Introducing Altaro Hyper-V Backup

Main features in Altaro Hyper-V Backup:

- **Hot Backups - MS VSS Integration**

Back up live VMs with zero downtime by leveraging the Microsoft VSS Hyper-V Writer.

- **Restore Clones**

Restore VMs to the same Hyper-V Host but with a different name.

- **Restore to different Hyper-V host**

Restore an individual or a group of VMs to a different Hyper-V Host.

- **ReverseDelta Incremental Backup**

Incremental Backup Technology for hyper-speed efficiency.

- **File Level Restore**

Mount backed up VHDs and restore files without having to restore a whole Virtual Machine.

- **Backs up Hyper-V clusters**

Cluster support for larger installations.

- **Backup schedules**

Set different backup schedules for different VMs.

- [Restore different versions](#)

Restore from multiple points in time rather than 'the most recent backup'

- [Supports Microsoft Hyper-V Server \(Core\)](#)

Works with the free Microsoft S Hyper-V Server (Core).

- [FireDrill Restore Tests](#)

Build a plan to make sure that in case of disaster you're fully covered.

- [Backs up Hyper-V Snapshots](#)

If your VMs have snapshots than you can back up the snapshots as well.

Different Editions

Free Edition

Back up 2 Hyper-V Guest VMs per Hyper-V Host	Yes
Store up to 4 weeks of old versions	Yes
Restore as clone.	No
Restore backups from different hosts	No
File Level Restore	No
Backs up VMs on Hyper-V Cluster (Full CSV Support)	No

Standard Edition

Back up 5 Hyper-V Guest VMs per Hyper-V Host	Yes
No limit on number of old versions stored	Yes
Restore as clone	Yes
Restore backups from different hosts	Yes
File Level Restore	Yes
Backs up VMs on Hyper-V Cluster (Full CSV Support)	No

Unlimited Edition

Back up unlimited Hyper-V Guest VMs per Hyper-V Host	Yes
No limit on number of old versions stored	Yes
Restore as clone	Yes
Restore backups from different hosts	Yes
File Level Restore	Yes
Backs up VMs on Hyper-V Cluster (Full CSV Support)	Yes

Getting Started

- [System Requirements](#)
- [Supported Backup Destinations](#)
- [Contacting Technical Support](#)

System requirements

Supported Host Operating Systems:

- Windows 2008 R2 (all editions)
- Windows 2008 R2 SP1
- Windows Hyper-V Server R2 (core installation)

Please note that Altaro Hyper-V Backup needs to be installed on the Hyper-V Host (not within the guest).

Required Specifications:

- 128 MB RAM
- 100 MB Hard Disk Space (for Altaro Hyper-V Backup Program and Settings files)
- MS .NET Framework 2.0

Supported Backup Destinations

Altaro Hyper-V Backup supports backing up to:

- USB External Drives
- eSata External Drives
- USB Flash Drives
- Fileserver Network Shares using UNC Paths
- NAS devices (Network Attached Storage) using UNC Paths
- PC Internal Hard Drives (recommended only for evaluation purposes)
- RDX Cartridges

Installing & Uninstalling

- [Installing Altaro Hyper-V Backup](#)
- [Entering the License Key](#)
- [Checking which version is installed](#)
- [Upgrading to a new build](#)
- [Uninstalling Altaro Hyper-V Backup](#)

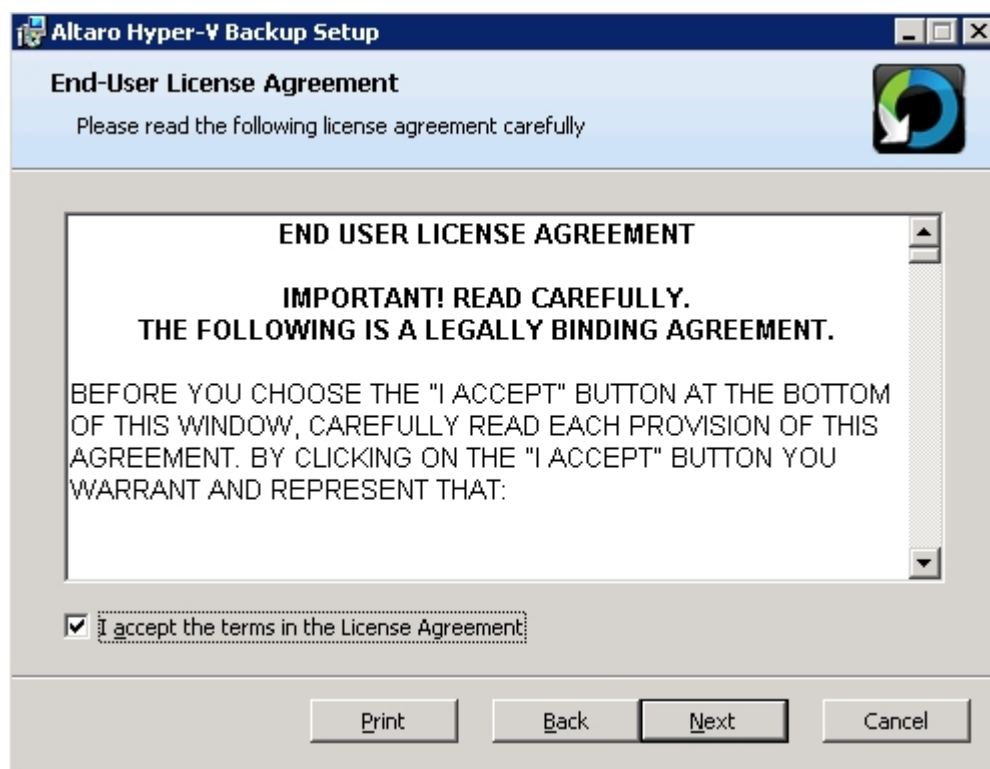

Installing Altaro Hyper-V Backup

If you do not have a copy of the installer for Altaro Hyper-V Backup please obtain a copy from www.altaro.com before following this tutorial.

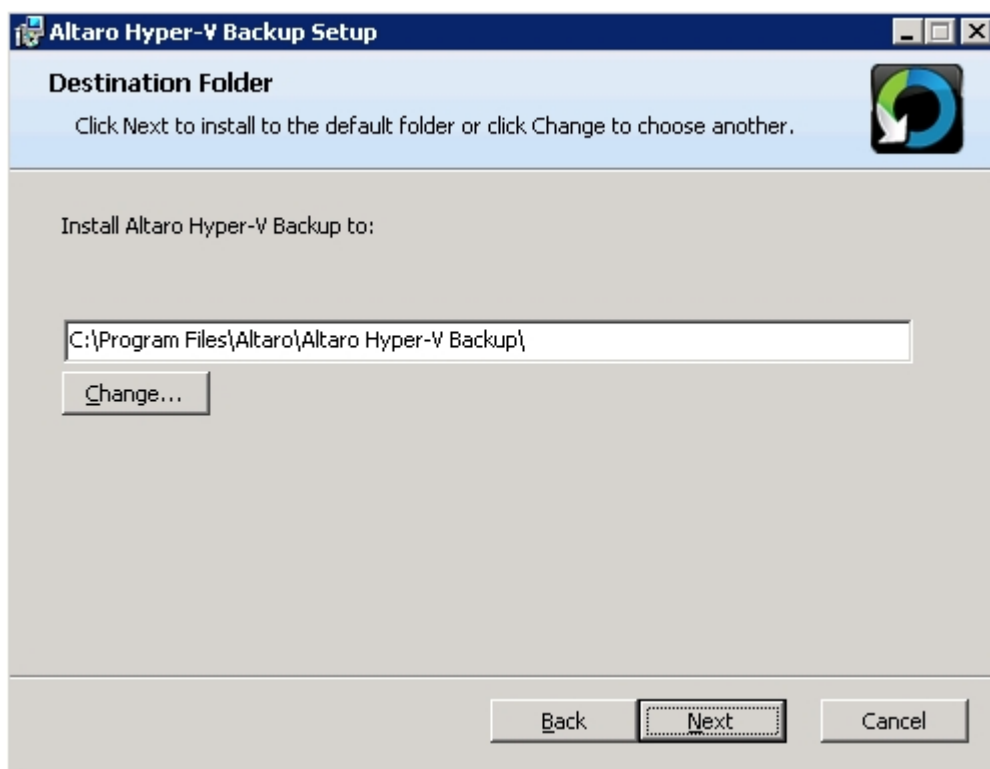

1. Launch the downloaded file: **altarohypervbackupsetup.exe**. On certain Operating Systems you may receive a warning informing you that certain downloads may be unsafe. Altaro Hyper-V Backup is signed using Altaro's digital signature and therefore this warning can be ignored.
2. Next you will be presented with the welcome screen of the installer. Simply click [Next].

3. You will now see the End User License Agreement into which you will enter with Altaro Ltd. Please read through the agreement and check the "I Accept..." checkbox. Once you have agreed to the terms and conditions in the EULA you can press [NEXT].

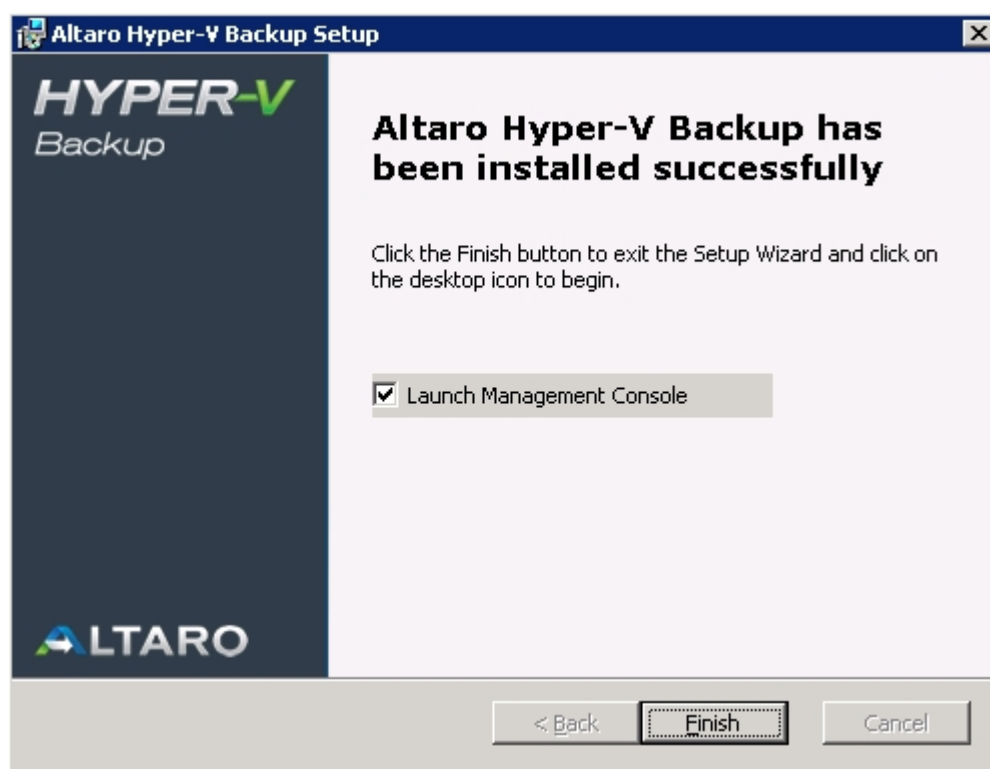

4. At this point you will be prompted for the Destination Folder of the installation. In most normal cases you should leave the installation path as default. Altaro Hyper-V Backup will be installed within your Program Files folder.

5. Next you will see a screen asking you for confirmation to install. Please press [Install].

6. At this point the installation will begin. You will be presented with a progress bar updating you with the progress of the installation. Installation should only take a few seconds. **Please note that if you have UAC enabled on the Server then a UAC prompt may be displayed.** Please click allow for the installation to complete. UAC is required for the following reasons:
- Files are being copied to the Program Files Folder.
 - A Windows Service is being installed.
7. Once the installation is done you will be presented with the successful installation screen. A checkbox is displayed and checked by default indicating whether the **Management Console** should be launched automatically.

Should a screen informing you that the installation has failed appear please contact [support](#).

8. Finally the Altaro Hyper-V Backup Management Console will appear. [Please click here for a tutorial on configuring your Backup Profile.](#)

Entering the License Key

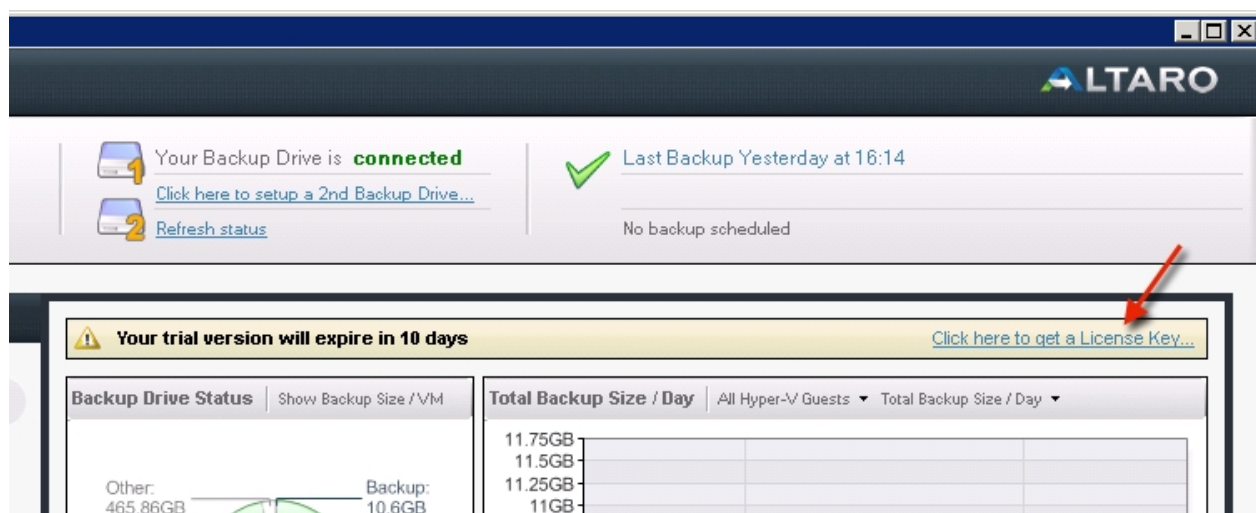

Once you order Altaro Hyper-V Backup you will receive an email containing your unique License Key. The License Key is a block of letters.

To enter your license key please follow these steps:

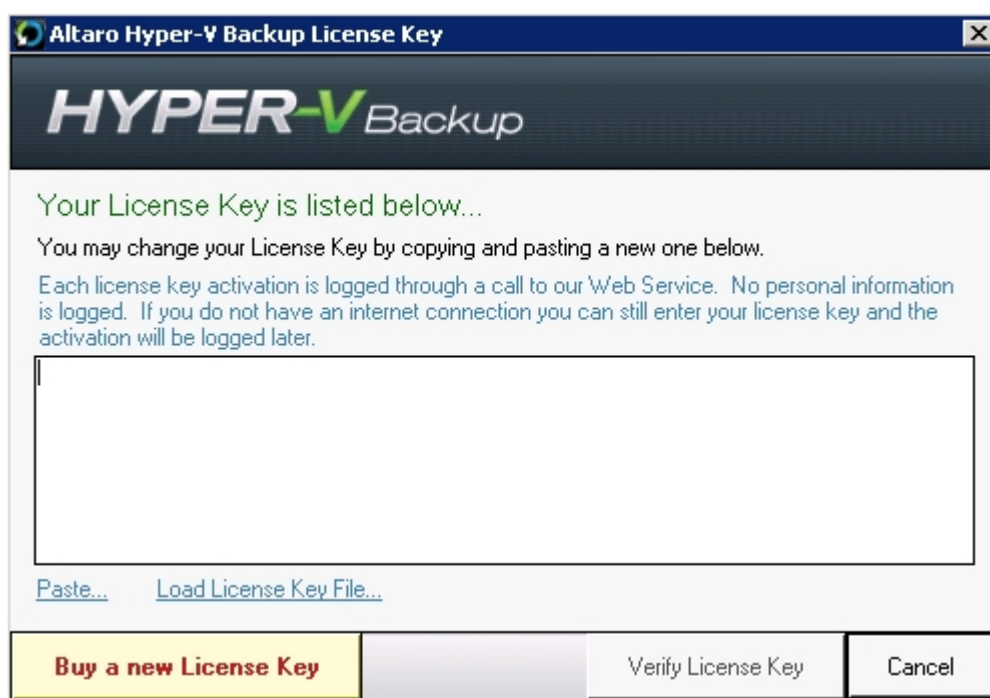

1. Launch the Altaro Hyper-V Backup **Management Console**.
2. Click '**Enter your License Key...**' from the bottom menu:

OR you may click on '**Click here to get License Key**' from the dashboard screen.

3. Next the license key window will appear as shown below.

4. Now open the email that contains your License Key. Once you select the License Key, right-click on it and select Copy.
5. Go back to the License Key window, right-click on the white text box and select Paste.
6. Click the button [Verify License Key] to verify your License Key. Once verified the window will change to confirm that the License Key was accepted by thanking you for purchasing the product.

Additional Steps when running under a Hyper-V Cluster Environment:

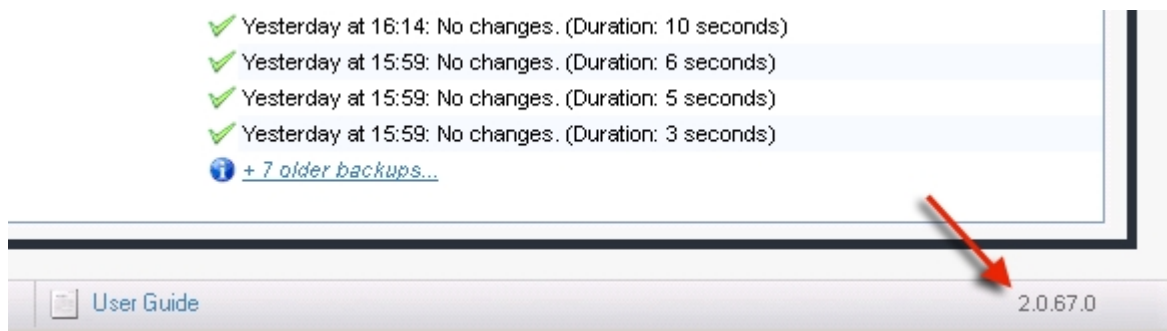

If a Cluster Environment is detected, then in the steps above, instead of the [Verify License Key] button you will see a [Choose Nodes...] button. This button will bring up the following Window which facilitates the licensing of each Node in the cluster.

Simply use the checkboxes in the list to identify which Nodes you would like to license. The number of Nodes allowed is dependent on the number of activations allowed by the License Key.

Checking which version is installed

Checking which version of Altaro Hyper-V Backup is installed is easy. Simply launch the Management Console by clicking on the **Altaro Hyper-V Backup** Start Menu item and check for the version number at the bottom right hand side of the Window.

In the example above version 2.0.67 is installed.

Upgrading to a new build

To upgrade Altaro Hyper-V Backup please follow the following three steps:

1. Exit the Altaro Hyper-V Backup Management Console from the top right control box.
2. Download the latest version of Altaro Hyper-V Backup from www.altaro.com. You can download the evaluation version and your license key information will be transferred to the new version.
3. Launch the installer and follow the [Installing Altaro Hyper-V Backup](#).

Your old backup settings, backup history and license key information will be migrated to the new version.

Important Note: The only difference between a first time installation and an upgrade is that the management console must be closed before attempting to upgrade. If the installer detects that the management console is running then you will be prompted to close it with the following dialog box.

Uninstalling Altaro Hyper-V Backup

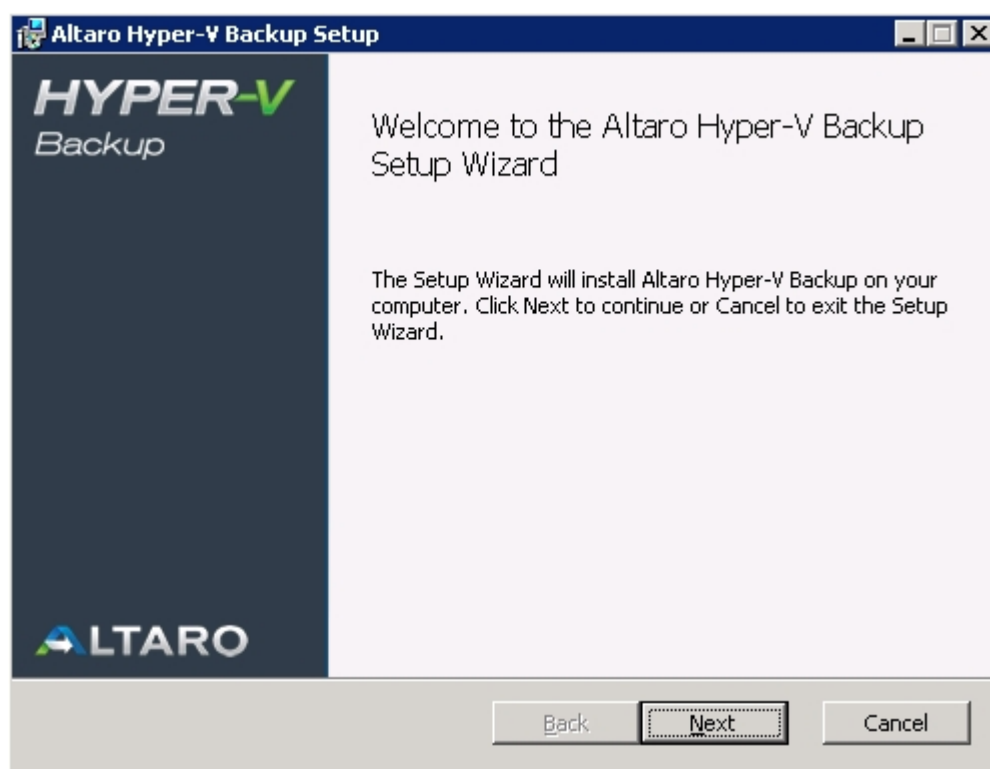

Important Note: Uninstalling **Altaro Hyper-V Backup** will only remove the software from your Server. Any backup data and settings created during usage of the application will be left on the Server and Backup Drive. This is important in case you need to restore data in the future.

Method 1: Using the Uninstall a program feature under the Windows Control Panel

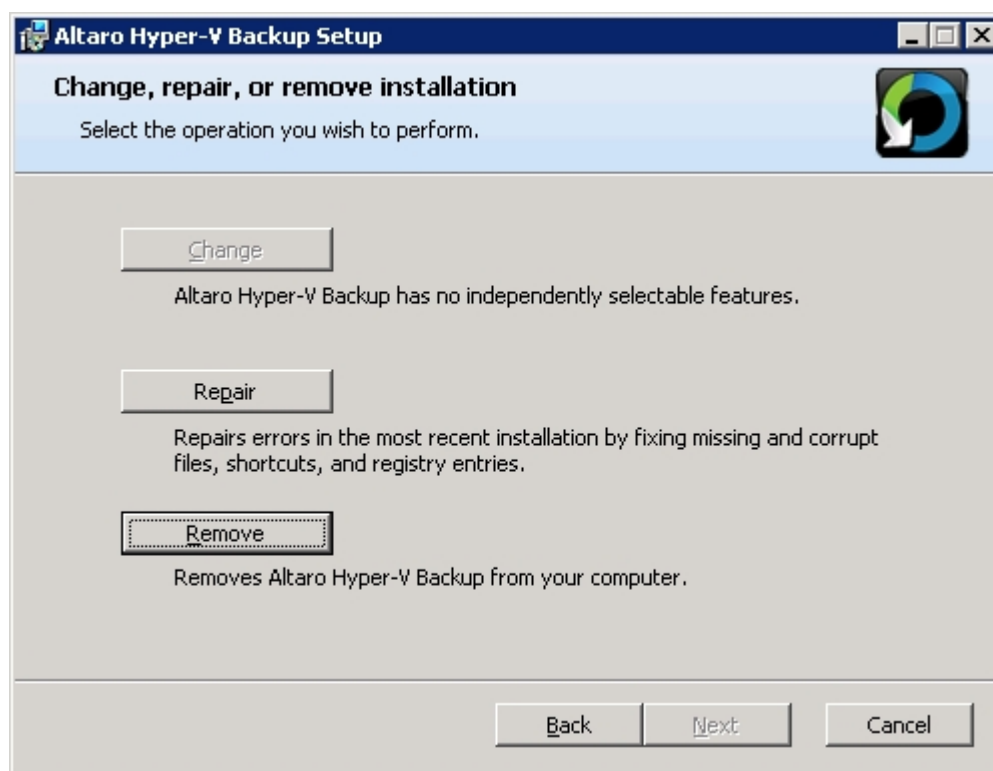

1. Click Start, then on Settings, then click Control Panel.
2. In Control Panel select **[Uninstall a program]**.
3. Once the window opens up you'll see a listing of the programs you have installed on your computer.
4. Highlight Altaro Hyper-V Backup and click **[Remove]** or **[Uninstall]**.
5. The program will begin to uninstall and will ask you for confirmation.
6. When the uninstall is completed you'll notice that it is no longer visible in the program list.
7. Close the dialog, and close the Control Panel.

Method 2: Using the original Altaro Hyper-V Backup installer

1. Launch the original installer: **altarohypervbackupsetup.exe**. On certain Operating Systems you may receive a warning informing you that certain downloads may be unsafe. Our software is signed using Altaro's digital signature and therefore this warning can be ignored.
2. Next you will be presented with the welcome screen of the installer. Simply click **[Next]**.

3. You will now see a screen with three options. At this point please choose the [Remove] option.

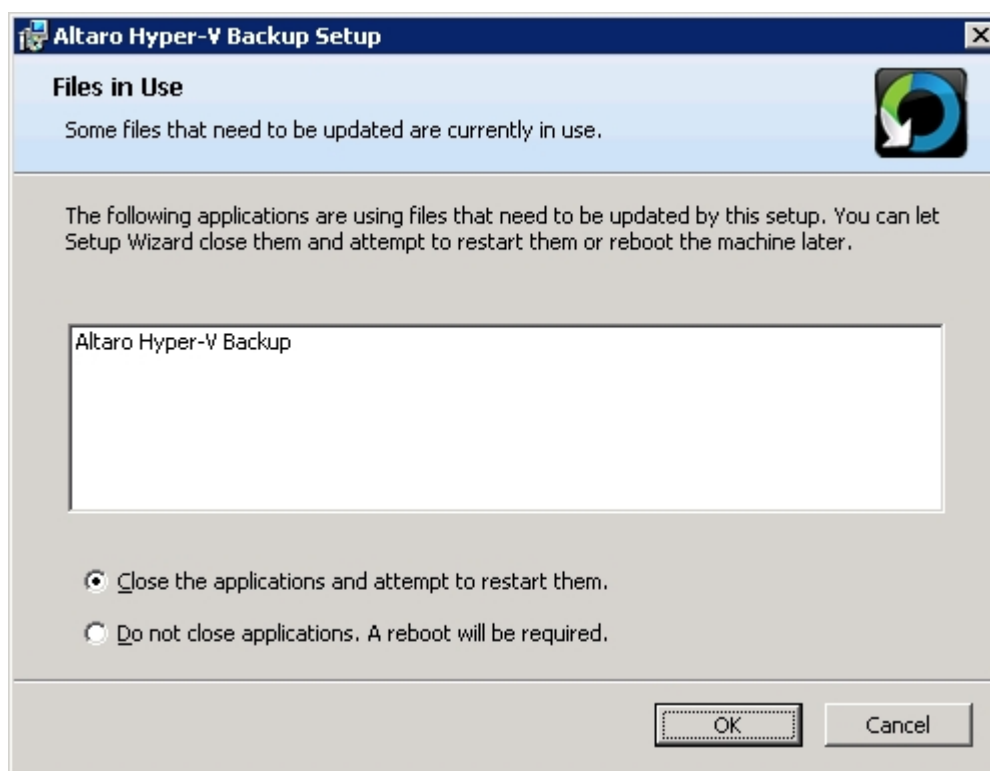

4. You will now be prompted with a confirmation to remove Altaro Hyper-V Backup. Please choose

[Remove] again.

5. If the Hyper-V Backup **Management Console** is running you will be prompted to close it. Please close it and proceed.

6. The uninstall progress will be displayed now. This should only take a few seconds.

7. Once Hyper-V Backup has been removed completely from your Server you will be presented with

the following screen.

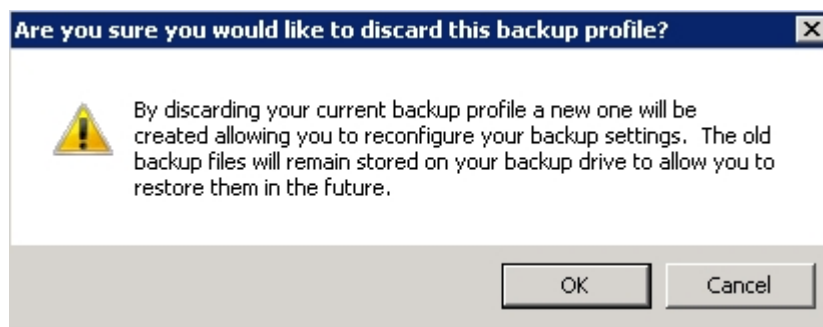

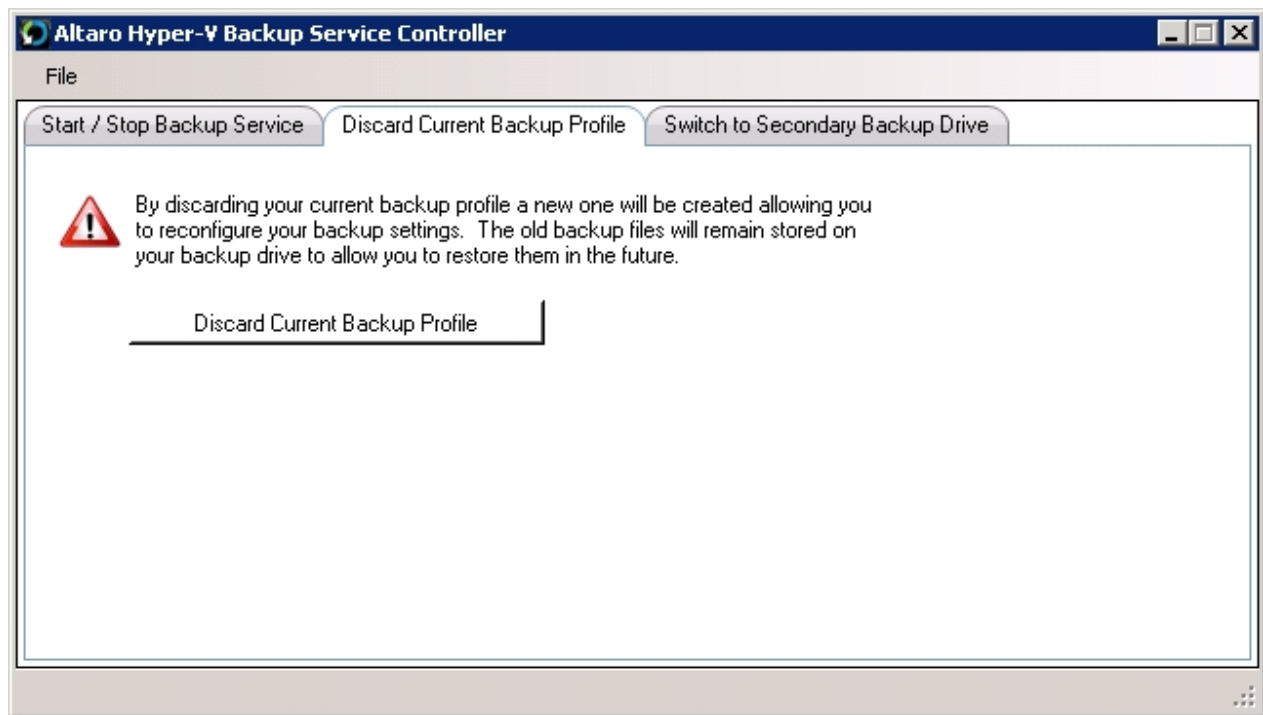

Should a screen informing you that the changes have failed appear please contact [support](#).

Restart Backup From Scratch

To start backing up again from scratch you can simply use the "Discard Current Backup Profile" feature in the **Altaro Hyper-V Backup Service Controller**. You can learn how to access the service controller [here](#).

Discard Current Backup Profile: This tab allows the user to discard the current backup profile and start a new one. Once the old backup profile is discarded, Hyper-V Backup can be reconfigured using the Management Console as described [here](#).

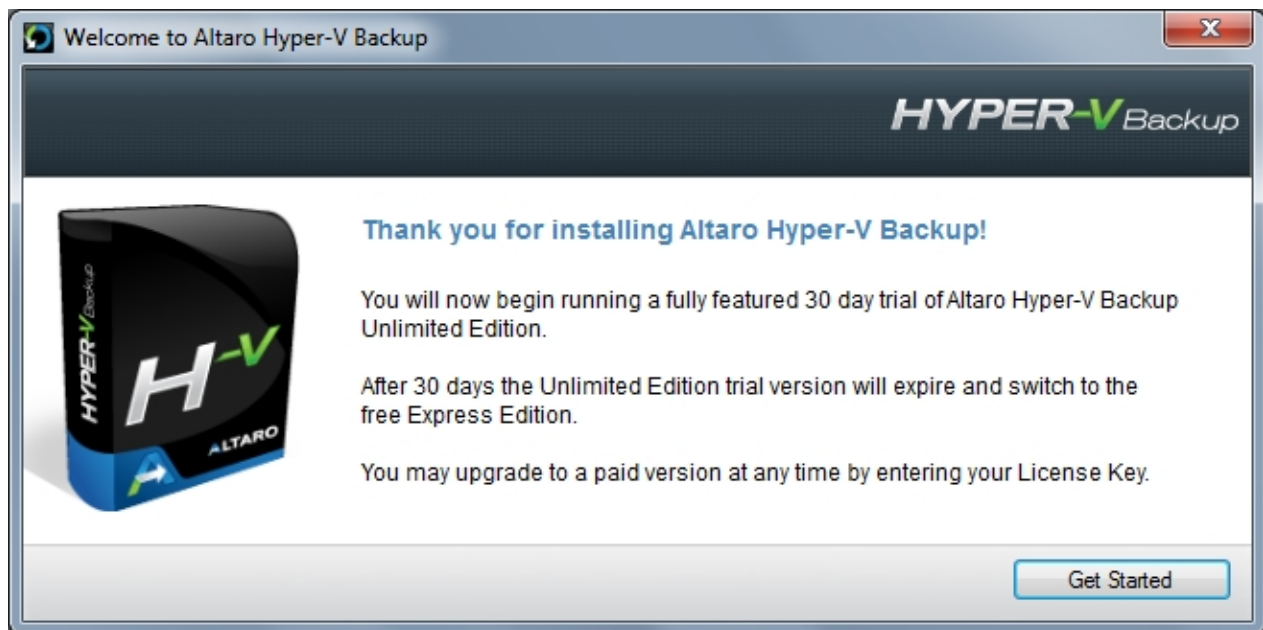

Configuration - Quick Start

Installing Altaro Hyper-V Backup in a Cluster CSV Environment

[Instructions for setting up Altaro Hyper-V Backup within a Cluster Environment](#)

Altaro Hyper-V Backup First Run

On first launch the Altaro Hyper-V Backup Evaluation mode will be enabled and you will be presented with the following dialog:

At any point during the evaluation you will be able to enter a License Key to activate a Hyper-V Backup Edition. If you choose not to purchase the software then you can activate the free Express Edition at the end of the Evaluation period. Read instructions on entering your license key [here](#).

The first time that you run Altaro Hyper-V Backup the **Management Console** will launch into a special configuration mode. This will help you to:

1. Select which Hyper-V Guest VMs you would like to backup. Read instructions [here](#).
2. Select which Backup Drive to backup to. Read instructions [here](#).
3. Enable and disable backup and restore notifications. Read instructions [here](#).

Opening the Management Console

The **Management Console** is opened automatically after you first install **Altaro Hyper-V Backup**.

After this you can launch it easily using one of the following methods:

- Clicking on the **Altaro Hyper-V Backup** item within the "Start Menu > All Programs > Altaro" group.
- Launching "Altaro Hyper-V Backup.exe" application from the install location. By default this is "C:\Program Files\Altaro\Altaro Hyper-V Backup".
- Enter the command **STARTALTARO** into a command prompt window. This may not work immediately after first install until you log out and in to the Server due to the Environment Variables not being refreshed.
- If the **Management Console** is already running in the background simply double click on the Altaro Hyper-V Backup System Tray icon.

Choosing VMs to back up

To select which Hyper-V Guest VMs to backup simply open the **Management Console** and select the option **[Select Hyper-V Guest VMs]** from the left hand side main menu.

Read instructions on how to open the Management Console [here](#).

1. Once you select "Step 1" you will be presented with the following panel:

Use the checkboxes to select which Hyper-V Guest VMs to add to your Backup Plan

Virtual Machines

Free Up Disk Space ▾

[Select All](#)
[Select None](#)

Name	Cluster Node
<input type="checkbox"/> WithoutOS (test switch 2)	FIFTYSEVEN
<input type="checkbox"/> WithoutOS (test restore to prog files)	FIFTYSEVEN
<input type="checkbox"/> WithoutOS (Test after switch)	FIFTYSEVEN
<input type="checkbox"/> WithoutOS (25-05-2011 09h41m32 Clone)	FIFTYSEVEN
<input type="checkbox"/> WithoutOS (25-05-2011 09h41m32 Clone)	FIFTYSEVEN
<input type="checkbox"/> WithoutOS (25-05-2011 09h41m32 Clone)	FIFTYSEVEN
<input type="checkbox"/> WithoutOS (23-05-2011 17h00m25 Clone TEST MC)	FIFTYSEVEN
<input type="checkbox"/> Windows 7 VM	FIFTYSEVEN

☒ Save Changes
 ☐ Discard Changes

2. Simply use the checkboxes to select which Hyper-V Guest VMs you would like to add to your backup plan.

- You can return to this screen at any time to add / remove Hyper-V Guest VMs.
- The selected VMs will not be backed up automatically until you setup a backup schedule or take a manual backup.
- Hyper-V Guests that have been deleted from the Hyper-V Host but have already been backed up will continue to show up in this list.

3. Once the selections have been made simply click on [Save Changes] to update your backup plan.

Selecting VMs on another Node within the Cluster:

If you wish to select VMs for backup which are currently hosted upon another Node within the cluster, you simply select them using the same steps above. The user interface will be a bit different within a cluster environment and you can read further instructions [here](#).

You must have first configured Altaro Hyper-V correctly for Cluster Support as explained [here](#).

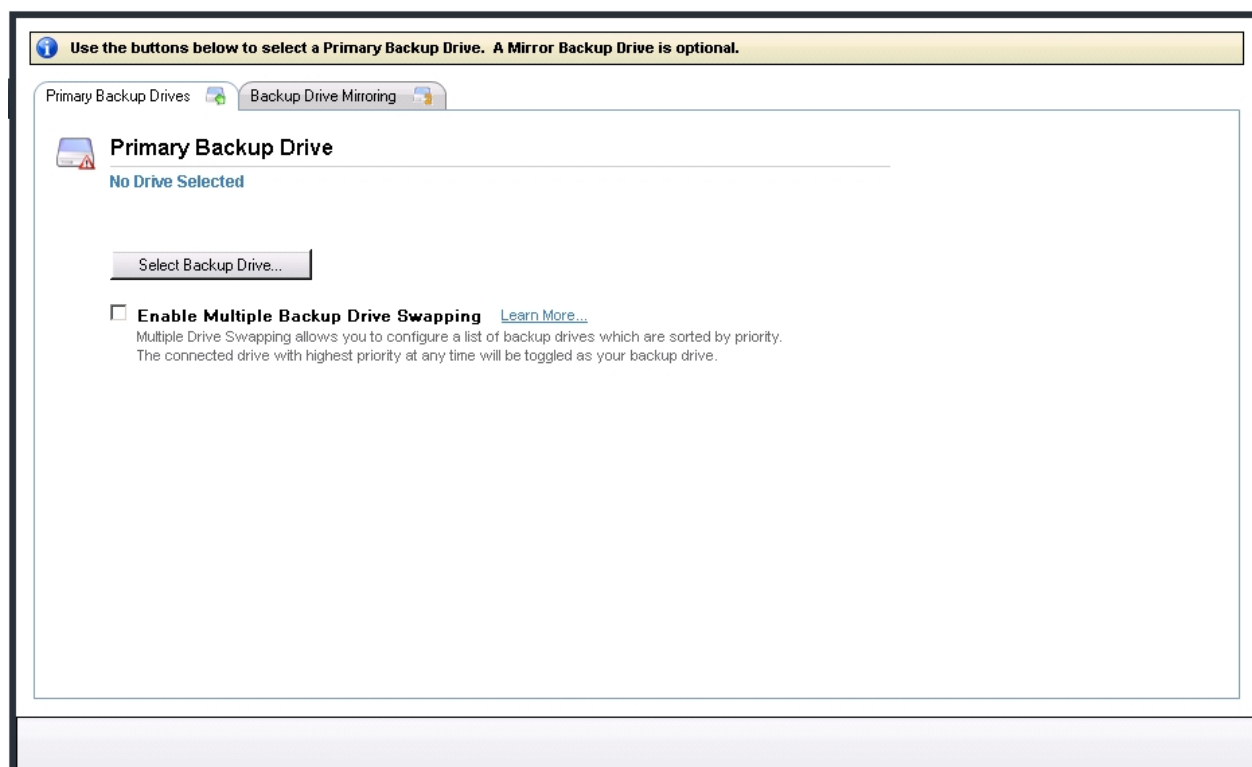

Selecting Backup Drive

To select a drive or network path as your backup destination, open the **Management Console** and select the option **[Select a Backup Drive]** from the left hand side menu.

Read instructions on how to open the Management Console [here](#).

Once you select "Step 2" you will be presented with the following panel:

2. Simply use the [Select Backup Drive...] and [Select Mirror Backup Drive...] buttons to select your backup drives.

- For instructions on configuring a backup drive click [here](#).
- For instructions on configuring a mirror backup drive click [here](#).
- For instructions on backing up to UNC network paths click [here](#).

3. Once the selections have been made there is no need to click save as changes are saved automatically.

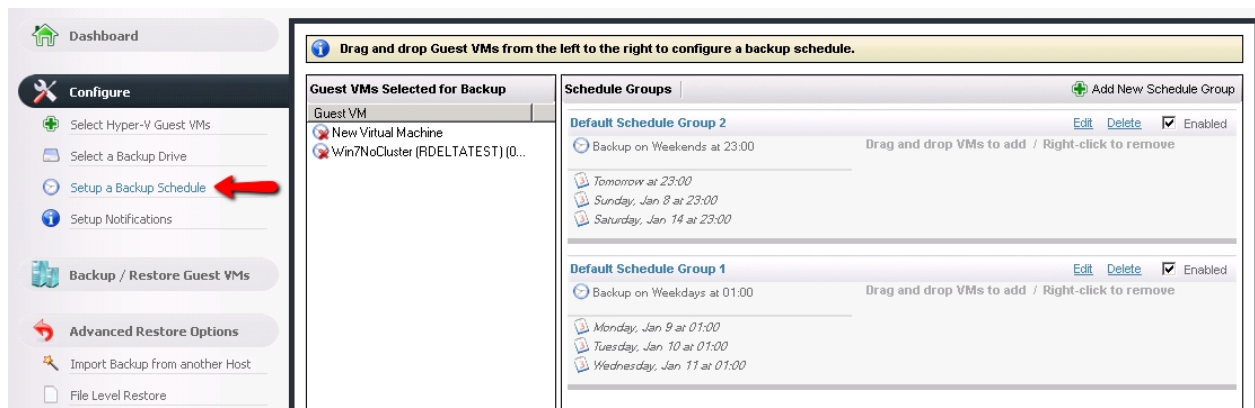

Selecting a Backup Drive within a Cluster Environment:

An additional step is required to share the backup drive with any Altaro Agents upon other nodes as explained [here](#).

Scheduling VM Backups

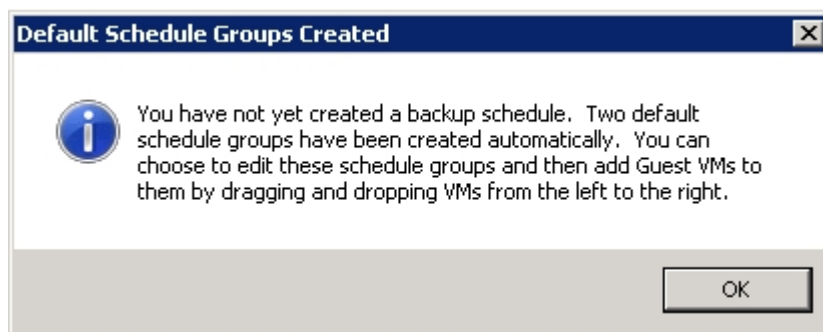

To schedule automatic backups for the selected VMs you need to create a number of Schedule Groups and add the VMs to them. To do this simply open the **Management Console** and select the option **[Setup a Backup Schedule]** from the left hand side main menu.

Read instructions on how to open the Management Console [here](#).

Default Backup Schedule Groups

If you have not yet created any backup schedule groups then two default groups will be created for you. These default groups can be used as they are, edited or deleted. In any case when the default groups are created you will be notified by the following Dialog prompt.

Adding a VM to a Schedule Group

Simply drag a VM (or multiple VMs) from the left hand side panel to the right hand side panel to add it to a Schedule Group. Once the VM is added it will be listed within the Schedule Group panel to indicate that it has been added successfully.

A single VM can be added to multiple schedule groups and a single schedule group can contain multiple VMs.

You must press [Save Changes] at the bottom of the screen to commit changes.

Removing a VM from a Schedule Group

To remove a VM from a schedule group simply right-click on the VM in the group's VM list and choose "Remove VM from this Schedule Group". The VM can be re-added at any time in the future.

You must press [Save Changes] at the bottom of the screen to commit changes.

Editing / deleting / disabling Schedule Groups

At the top left of each schedule group are three buttons:

- Edit - change the schedule group backup schedule.
- Delete - discard the schedule group. Any VMs belonging to it will be unassigned from it first.
- Enabled [y/n] - choose whether the group is active or has been disabled. Backups will not take place for disabled schedule groups.

You must press [Save Changes] at the bottom of the screen to commit changes.

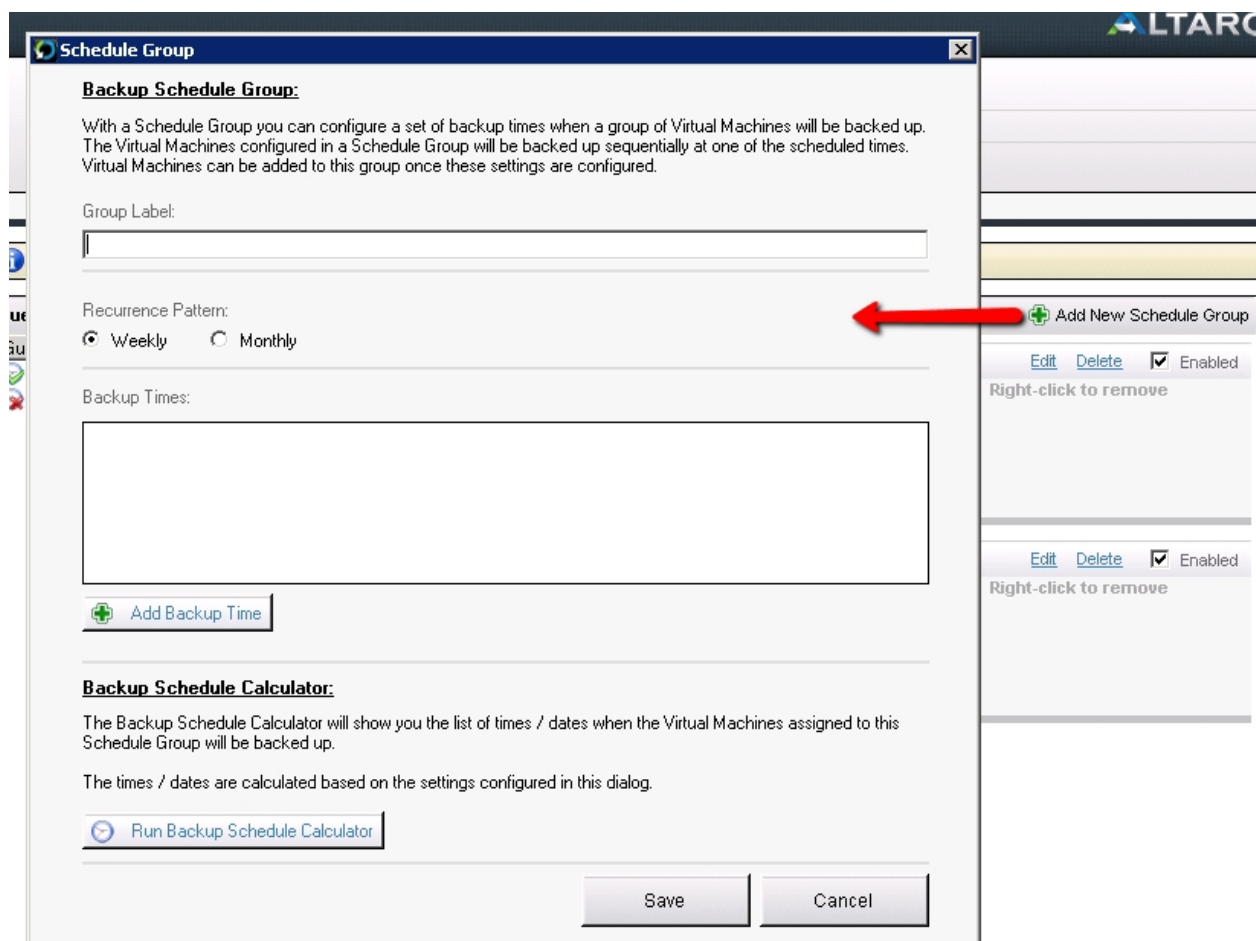

Create a Schedule Group

To create a new schedule group click on the "Add New Schedule Group" button. You will be presented by a Window which will prompt you for the schedule group settings.

Group Label: a name given to the group to help you to identify it. This name is simply used for the user to identify the group easily.

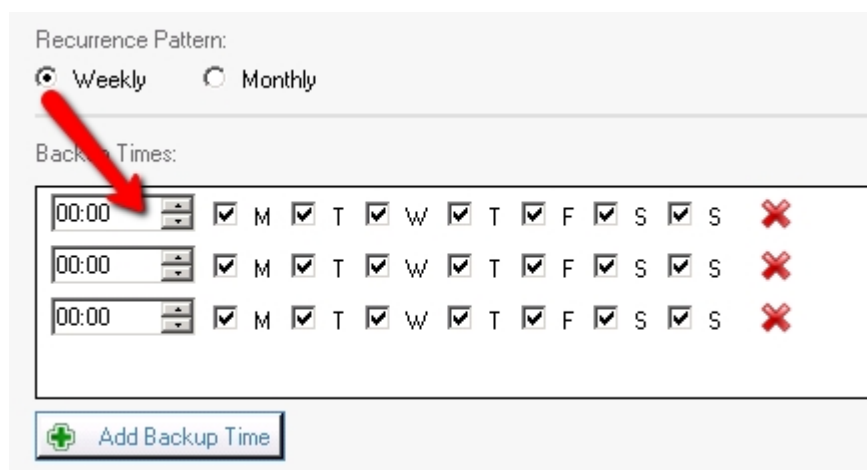

Recurrence Pattern: whether you would like to configure a weekly or monthly recurrence.

Backup Times / Options: settings to specify the backup times / days

Weekly Recurrence

1. Select the weekly radio button.
2. Click "Add Backup Time" to add a new backup time entry to the list.
3. Configure multiple backup times. eg. 10am on Mon, Tue and Friday.
4. These backup times will be repeated on a weekly basis.

Monthly Recurrence

1. Select the monthly radio button.
2. Choose whether you wish the backup to take place on the:
 - Xth day of every month. eg: 10th day of every month.
 - The Xth day of week of every month. eg: 2nd Wed of every month.

Recurrence Pattern:

☐ Weekly ☒ Monthly

Backup Times:

☐ Day of every Month at

☒ The of every Month at

Monday
Tuesday
Wednesday
Thursday
Friday
Saturday
Sunday

Run the Backup Schedule Calculator before saving changes

You can verify the above settings by simulating the next 25 backup times. To do this click on [Run Backup Schedule Calculator] and you will see a list of the next 25 backup times.

Guest VM - Backup Schedule Overview

Schedule Overview:

The list below displays the times and dates when these times are based on the configured schedule settings (only the next 25 backup times are shown)

☒ The 1st Tuesday of every Month at 10:00

- Tuesday, Feb 7 at 10:00
- Tuesday, Mar 6 at 10:00
- Tuesday, Apr 3 at 10:00
- Tuesday, May 1 at 10:00
- Tuesday, Jun 5 at 10:00
- Tuesday, Jul 3 at 10:00
- Tuesday, Aug 7 at 10:00
- Tuesday, Sep 4 at 10:00
- Tuesday, Oct 2 at 10:00
- Tuesday, Nov 6 at 10:00

Backup Schedule Calculator:

The Backup Schedule Calculator will show you the Schedule Group will be backed up.

The times / dates are calculated based on the settings

☒ Run Backup Schedule Calculator

Conclusion

Once the Backup Schedule has been set you will notice that the schedule label in the [Backup / Restore](#) screen has changed.

In the case of a VM with no backup schedule set you will see:

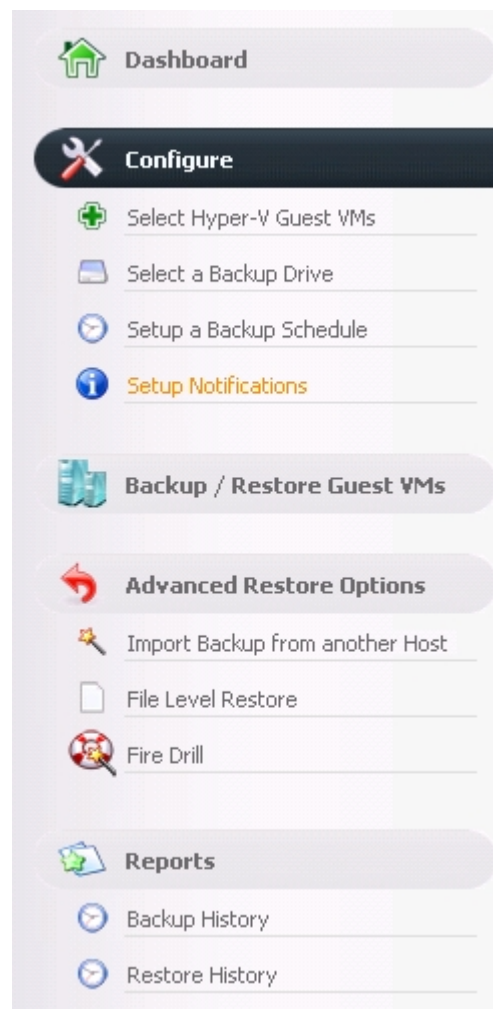

In the case of a VM where a backup schedule has been configured you will see:

Enabling Notifications

To select which notifications to receive simply open the **Management Console** and select the option **[Setup Notifications]** from the left hand side main menu.

Read instructions on how to open the Management Console [here](#).

1. Once you select "Setup Notifications" you will be presented with the following panel:

The screenshot shows a window titled "Configure the notification settings and mail server details below to receive alerts." Inside, there's a section for "Notification Settings" with two tabs: "Event Log Notifications" (selected) and "Email Notification Settings". Under the "Event Log Notifications" tab, there are four unchecked checkboxes:

- ☐ Add an entry to the Event Log for Successful Backups
- ☐ Add an entry to the Event Log for Backups with skipped files
- ☐ Add an entry to the Event Log for Failed Backups
- ☐ Add an entry to the Event Log for completed restore operations

At the bottom right of the panel, there are two buttons: "Save Changes" (with a checkmark icon) and "Discard Changes" (with an 'X' icon).

2. Simply use the checkboxes to select which notifications you would like to receive.
 - To learn how to configure Event Log notifications click [here](#).
 - To learn how to configure Email notifications click [here](#).
3. Once the selections have been made simply click on [Save Changes] to update your backup plan.

Email Notifications

Email Notifications allow users to receive Backup / Restore Reports by email. These reports indicate:

Backup Reports

- The status of each backup and the Hyper-V Guest VM that was backed up.
- The date and time of each backup.
- The amount of data backed up.
- The number of changed files.
- The number of skipped files.

- The duration of the backup.

Restore Reports

- The status of each restore operation and the Hyper-V Guest VM that was restored.
- The date and time of each restore operation.
- The duration of the restore operation.

Here is an example of a Backup Report:

Altaro Hyper-V Backup: Backup Report for C74 (08 Jun 2011 16:17) Inbox | X

☆ [show details](#) 8 Jun (2 days ago) [Reply](#) ▼

HYPER-V Backup

- ✓ **Today at 16:14** **Successful Backup** Testin2_scsi (08-06-2011 13h18m07 Clone)
Backed up a total of 532.02 MB for 4 changes. (Duration: 36 seconds)
- ✓ **Today at 16:14** **Successful Backup** Testin2_scsi (03-06-2011 12h24m46 Clone)1
No changes. (Duration: 18 seconds)
- ✓ **Today at 16:14** **Successful Backup** Testing3_iso
No changes. (Duration: 13 seconds)
- ✓ **Today at 16:14** **Successful Backup** Testing1
No changes. (Duration: 8 seconds)
- ✓ **Today at 16:14** **Successful Backup** Testin2_scsi
No changes. (Duration: 10 seconds)

Altaro Backup Software
<http://www.altaro.com>

Here is an example of a Restore Report:

Altaro Hyper-V Backup: Backup Report for C74 (08 Jun 2011 15:21) Inbox | X

☆ [show details](#) 8 Jun (2 days ago) [Reply](#) ▼

HYPER-V Backup

✓ **Today at 15:20** **Restore Successful** Testing3_iso (03-06-2011 12h27m07 Clone)1
Successfully restored the backup of 08-Jun-2011 14:17 in 32 seconds.

Altaro Backup Software
<http://www.altaro.com>

Configuring Email Notifications in order to receive Backup Reports:

- Navigate to the **Setup Notifications** screen as shown [here](#).
- Once within the **Setup Notifications** screen simply select the [Email Notification Settings] tab.

Configure the notification settings and mail server details below to receive alerts.

Notification Settings

Event Log Notifications | **Email Notification Settings**

☐ Send Email notifications for Successful Backups
☐ Send Email notifications for Backups with skipped files
☐ Send Email notifications for Failed Backups
☐ Send Email notifications for completed restore operations

☒ Send Email notifications Immediately Emails will be sent at least 5 minutes apart
☐ Queue Email notifications and send as a daily Email at

SMTP Server Address
 SMTP Server Port
 Use SSL Encryption ☐

☐ The outgoing mail server (SMTP) requires authentication
 User Name
 Password

- Use the checkboxes to specify which notifications you would like to receive by email:
 - You can choose to receive notifications for: successful backups, backups in which one or more file was skipped, failed backups and completed restore operations.
 - If you choose to receive notifications for failed backups you will also be alerted when a backup is skipped because your backup drive is not connected.
- Next specify the frequency of your Email notifications. There are two options:
 - Immediately after the operation has completed. (Emails will be sent a minimum of 5 minutes apart and multiple notifications may be grouped into one email).
 - As a daily email digest at a specified time each day.
- Finally configure your SMTP mail server settings and the email recipients. The [Send Test Email] button can be used to test the SMTP settings.
- Once you've finished configuring the Email notifications click on the [Save Changes] button at the bottom of the screen.

Event Log Notifications

Event Log Notifications can be viewed within the Event Viewer console on Windows Server. These are ideal for monitoring the backup and restore operations remotely from another server.

These log entries indicate the following information:

Backup Reports

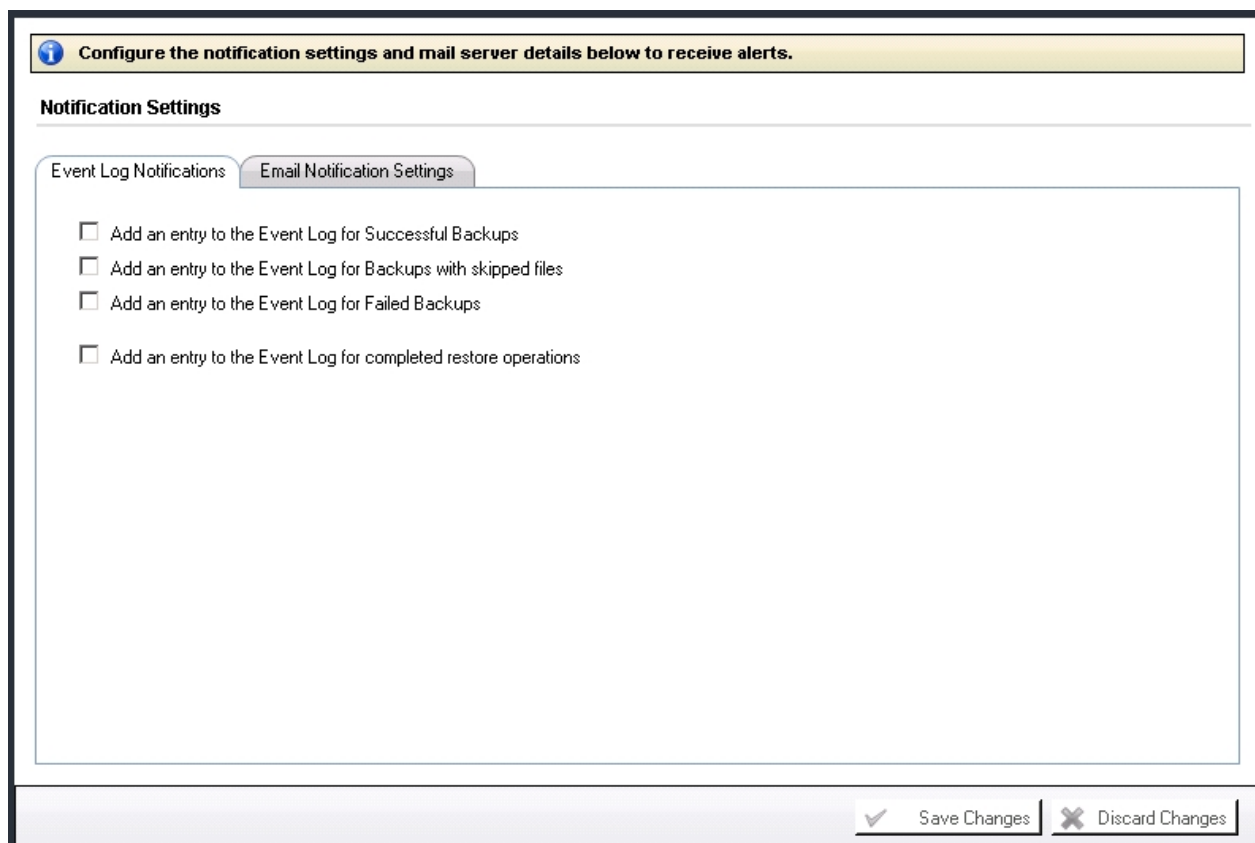

- The status of each backup and the Hyper-V Guest VM that was backed up.
- The date and time of each backup.
- The amount of data backed up.
- The number of changed files.
- The number of skipped files.
- The duration of the backup.

Restore Reports

- The status of each restore operation and the Hyper-V Guest VM that was restored.
- The date and time of each restore operation.
- The duration of the restore operation.

Configuring Event Log Notifications in order to receive Backup Reports:

- Navigate to the **Setup Notifications** screen as shown [here](#).
- Once within the **Setup Notifications** screen simply select the [Event Log Notifications] tab.

Configure the notification settings and mail server details below to receive alerts.

Notification Settings

Event Log Notifications | Email Notification Settings

- ☐ Add an entry to the Event Log for Successful Backups
- ☐ Add an entry to the Event Log for Backups with skipped files
- ☐ Add an entry to the Event Log for Failed Backups
- ☐ Add an entry to the Event Log for completed restore operations

✓ Save Changes | ✕ Discard Changes

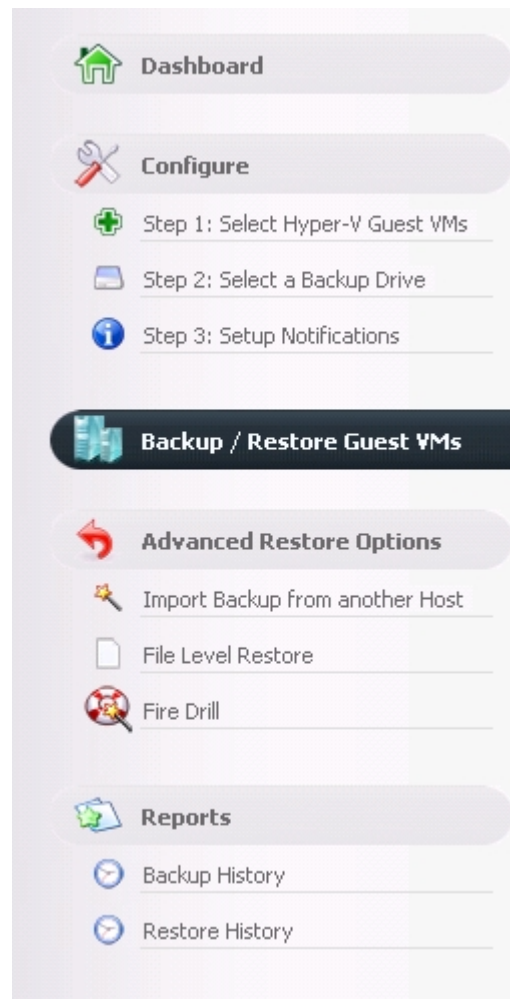

- Use the checkboxes to specify which notifications you would like to log:
 - You can choose to receive notifications for: successful backups, backups in which one or more file was skipped, failed backups and completed restore operations.
 - If you choose to receive notifications for failed backups you will also be alerted when a backup is skipped because your backup drive is not connected.
- Once you've finished configuring the Event Log notifications click on the [Save Changes] button at the bottom of the screen.

Configuring a VM's Backup Settings

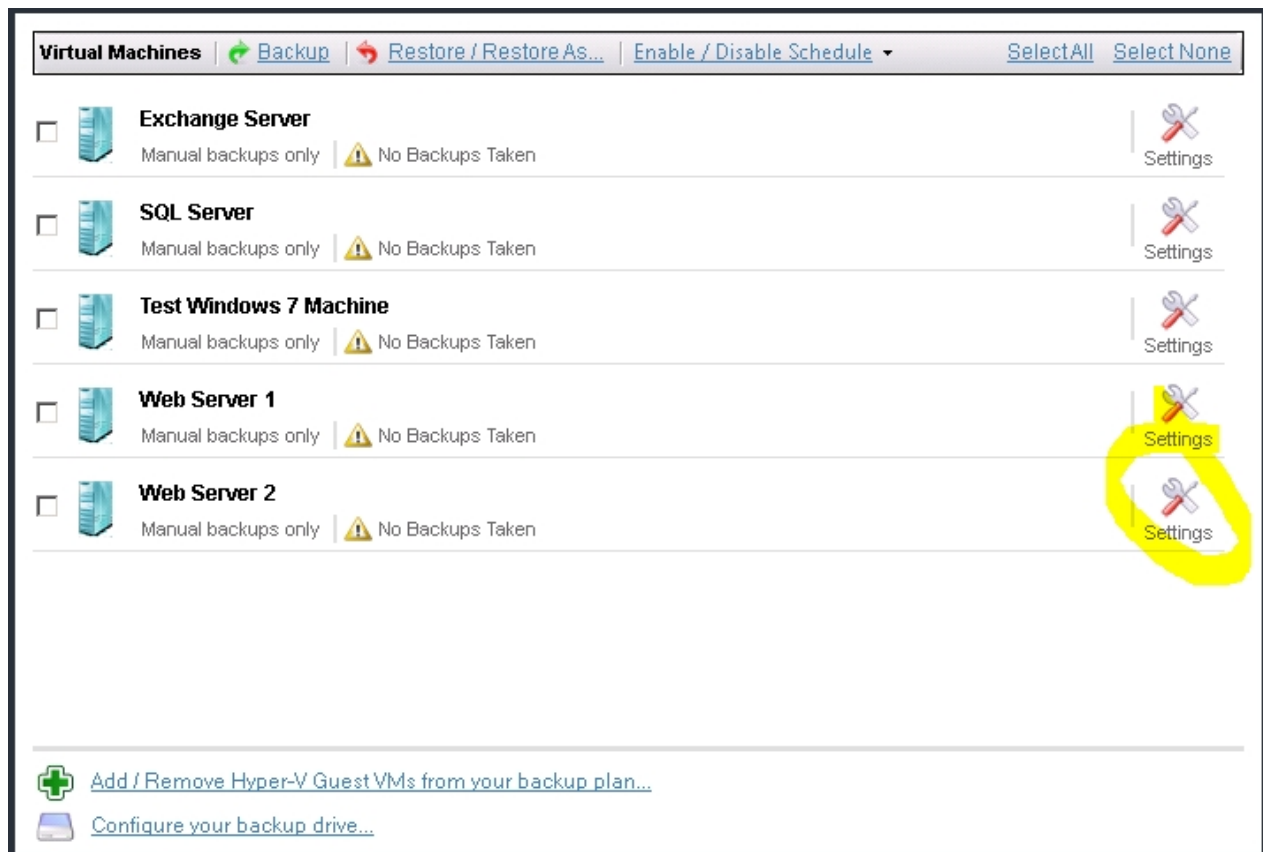

The final step in configuring **Altaro Hyper-V Backup** is to configure an actual Backup Plan for each selected Guest VM. This is simple and can be achieved by navigating to the "Advanced Settings" window of each Guest VM.

This can be achieved by following these steps:

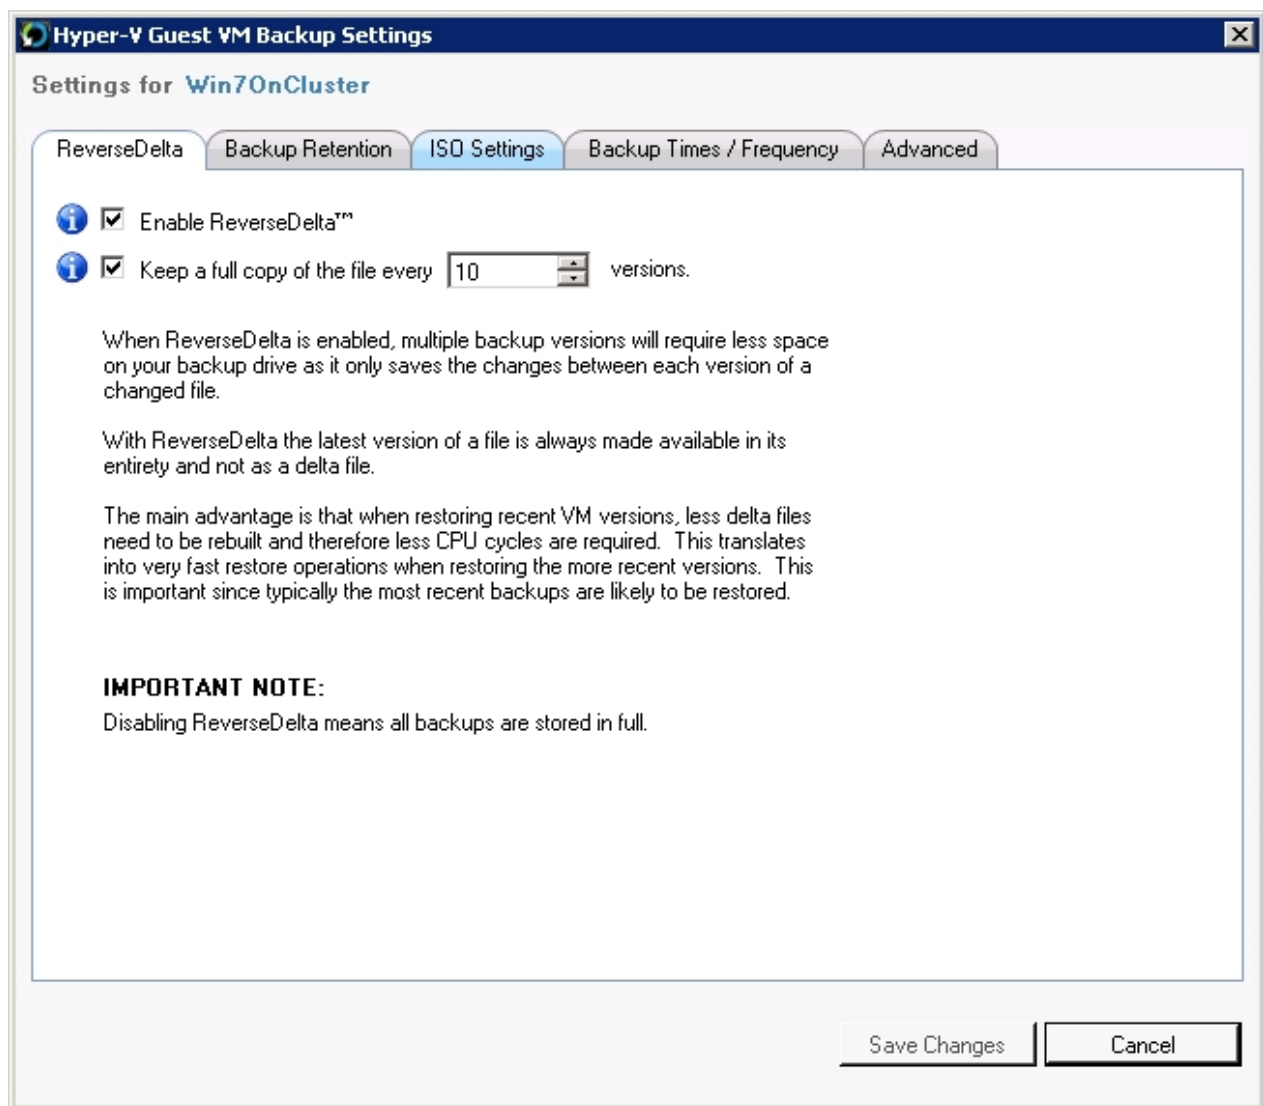

1. Open the **Management Console** as described [here](#).
2. Navigate to the "**Backup / Restore Hyper-V Guest VMs**" screen.

3. You will be presented with the following screen. Please note the "Spanner and Wrench" icons to the right hand side of each VM.

4. Clicking on a "Spanner and Wrench" icon will display the "Advanced Settings" window for the VM in question.

5. From the advanced settings Window you can do the following:

- Enable / Disable Reverse Delta. Click [here](#) for more details.
- Choose how many versions to keep of the VM and choose a schedule for deleting old versions. Click [here](#) for more details.
- Choose whether to backup ISO files which are attached to the VM. Click [here](#) for more details.
- Choose whether to enable Live Backups for Non-VSS Aware Guests (Crash-Consistent Backups). Click [here](#) for more details.

Backup for Cluster Environments

[The Master Controller Node vs. Background Agents](#)

[Configuring for a Hyper-V Cluster Environment](#)

[Dashboard Cluster Status Tab](#)

[Selecting VMs for backup \(Cluster Environment\)](#)

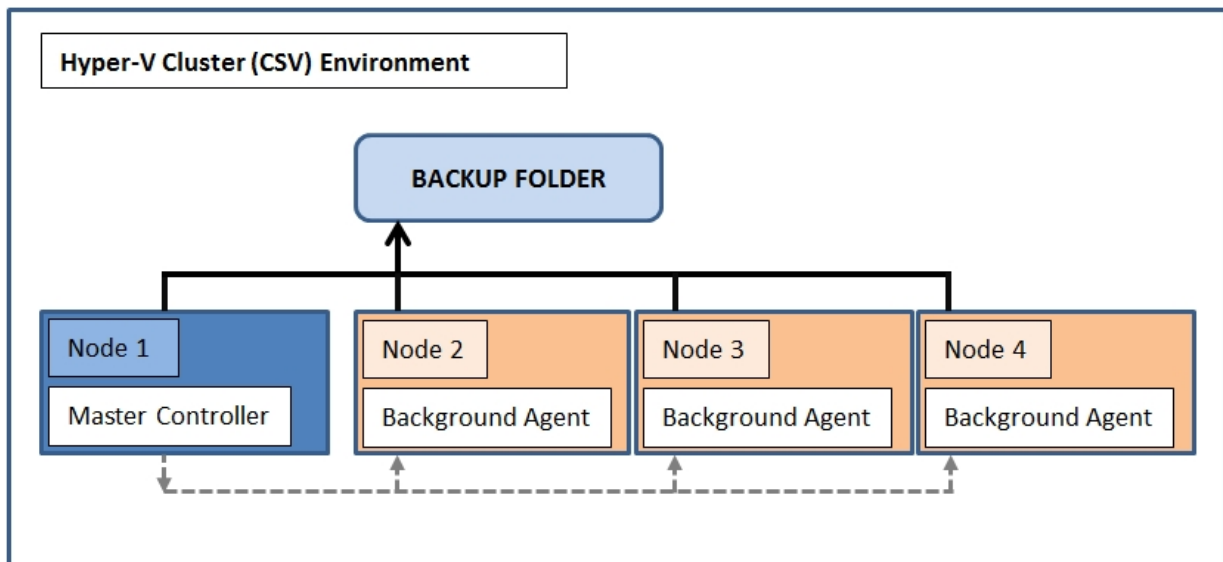

[Selecting a backup drive \(Cluster Environment\)](#)

[Configuring the Altaro Agent upon a remote Node](#)

[Other considerations when using Altaro Agents](#)

[Firewall Rules / Communication between nodes](#)

The Master Controller Node vs. Background Agents

The Master Controller Node

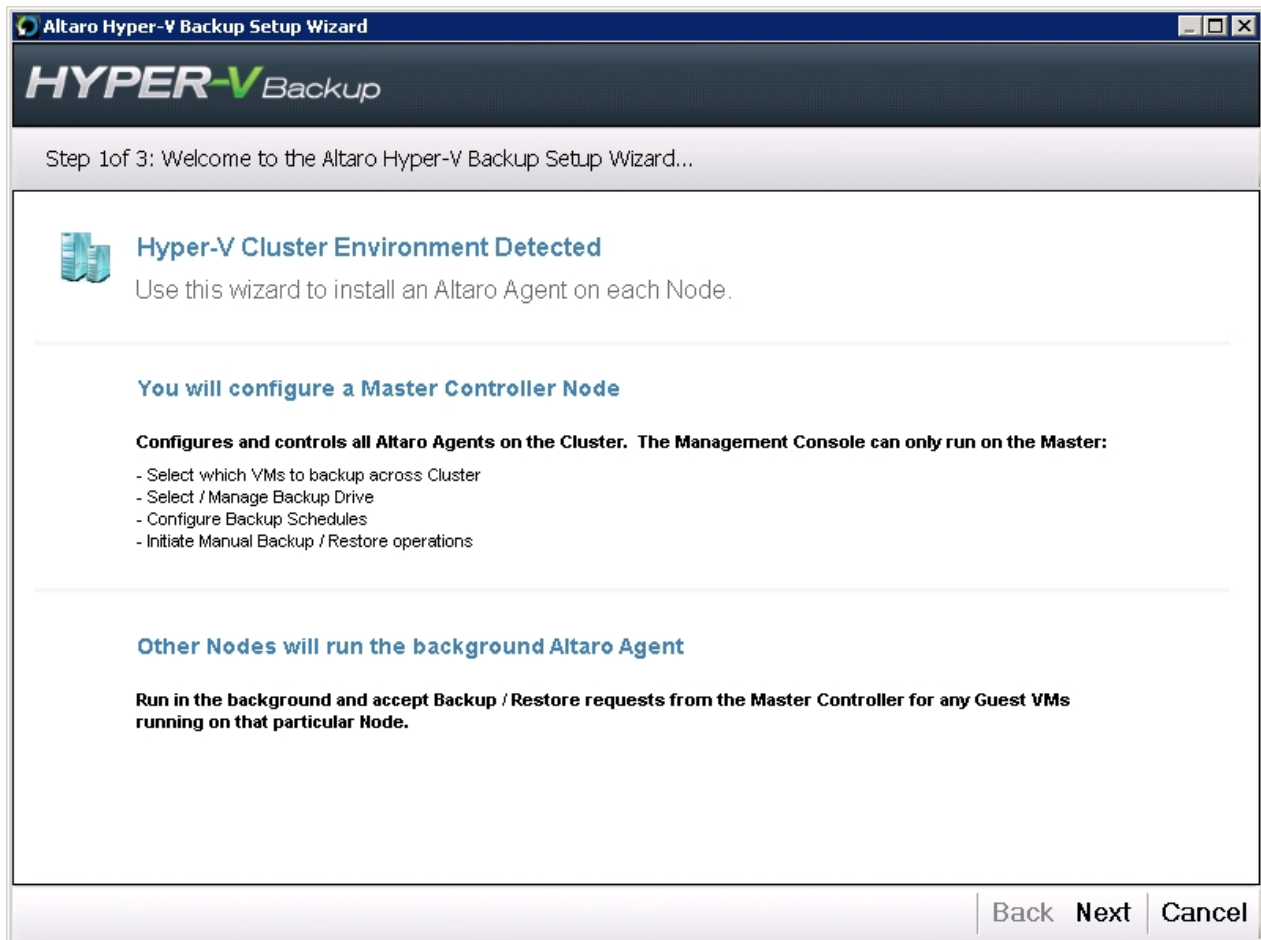

- The Master Controller node configures and controls all the Altaro Background Agents on the cluster.
- The Management Console User Interface must be run on the Master Controller.
- Select which VMs to backup across the Cluster
- Select / Manage Backup Drive
- Configure Backup Schedules
- Initiate Manual Backup / Restore Operations

Altaro Background Agent Nodes

- Run in the background and accept backup and restore requests from the Master Controller node for any Guest VMs running on that particular Node.

Configuring for a Hyper-V Cluster Environment

When installing for the first time within a Hyper-V Cluster Environment a Setup Wizard will be displayed.

1. Choose which node will be the Master Controller Node and which nodes will be installed as Background Agents. It is recommended that the node upon which you are running the setup wizard is configured as the Master Controller Node.

Altaro Hyper-V Backup Setup Wizard

HYPER-V Backup

Step 2 of 3: Configure Altaro Agents...

To configure Altaro Hyper-V Backup you need to choose the node from where you will manage the backup and restores of all the VM across all the nodes. This node is referred to as the Altaro Master Controller.

The node below has been chosen automatically as the node where the Altaro Master Controller will be installed. Please note that this setting can be changed later.

Install the Altaro Master Controller on the node:

 **HVN3-1 (Recommended)** ▾

To back up VMs running on all the nodes an Altaro Background Agent is required on each node in the cluster. The Altaro Backup Agent is controlled and receives requestions from the Altaro Master Controller.

Choose which nodes to install the Altaro Backup Agent on:

These will be controlled by the Altaro Master Controller Node

 hvn3-2	<div>Install Background Backup Agent ▾</div> <div>Selected VMs on this node will be backed up.</div>
 hvn3-3	<div>Install Background Backup Agent ▾</div> <div>Selected VMs on this node will be backed up.</div>

Back Next Cancel

Any node which has not yet been configured can be chosen as a Master Controller Node.

Install the Altaro Master Controller on the node:

 **HVN3-1 (Recommended)** ▾

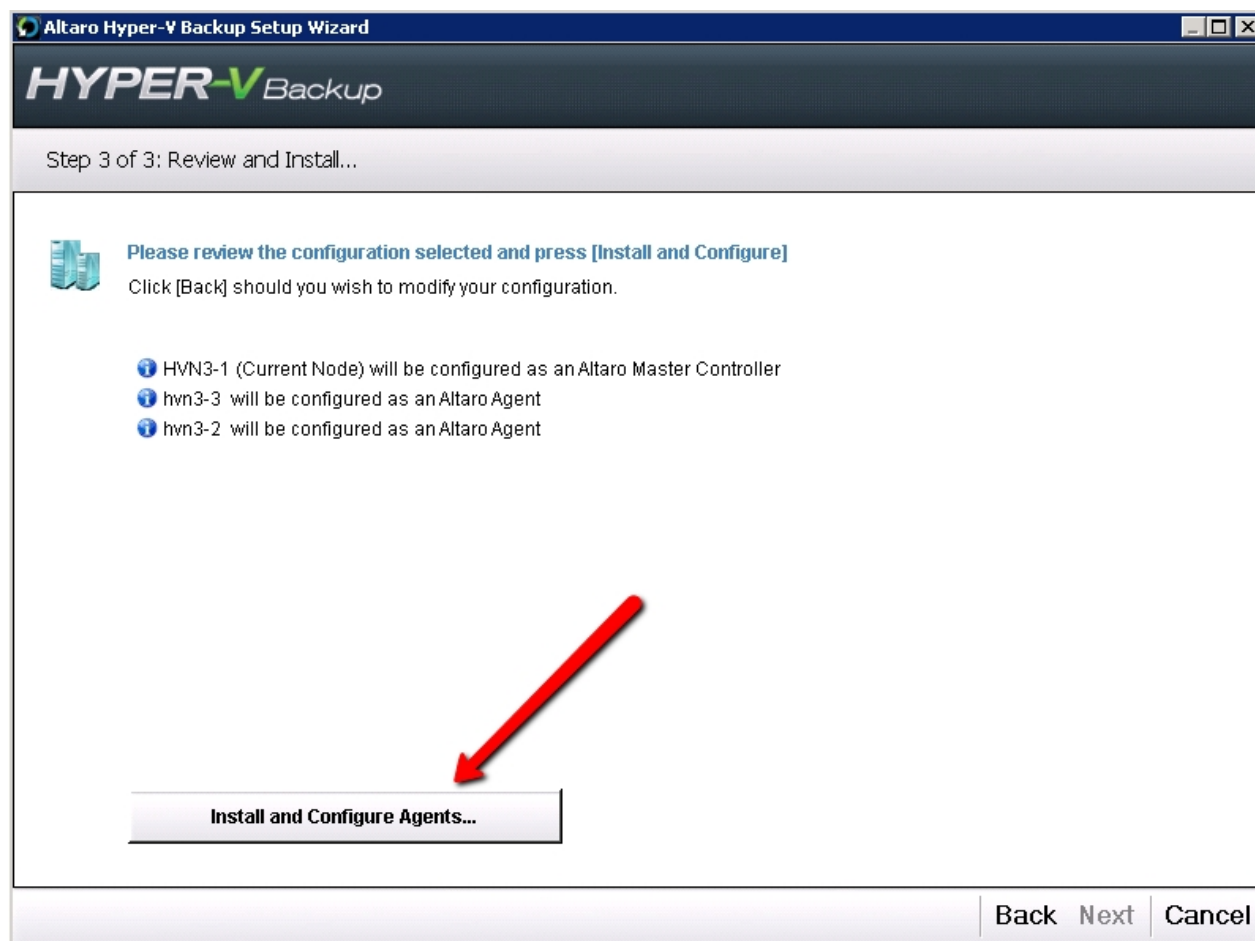

HVN3-1 (Recommended)

hvn3-3

hvn3-2

To back up VMs running on all the nodes an Altaro Background Agent is required on each node in the cluster. The Altaro Backup Agent is controlled and receives requestions from the Altaro Master Controller.

2. Review the configuration settings and click on **"Install and Configure Agents"**.

3. You will now be presented with a progress bar. If you have many nodes then this may take a few minutes. Once the installation is complete you will see a summary of the installation results as shown below. If any of the nodes fail to install press [BACK] and try again. Otherwise press [NEXT].

Altaro Hyper-V Backup has been installed successfully

Click [Next] to configure your backup settings.

- ✓ HVN3-1 successfully configured as the Master Controller.
- ✓ hvn3-3 successfully configured as an Altaro Agent.
- ✓ hvn3-2 successfully configured as an Altaro Agent.

Note: If you chose to configure the current Node as a Background Agent then you must switch to the Master Controller Node to launch the Management Console.

4. The Management Console will now be launched automatically if the current node was configured as the Master Controller. You will be then be taken to the Hyper-V Guest Selection Screen.

Next Steps:

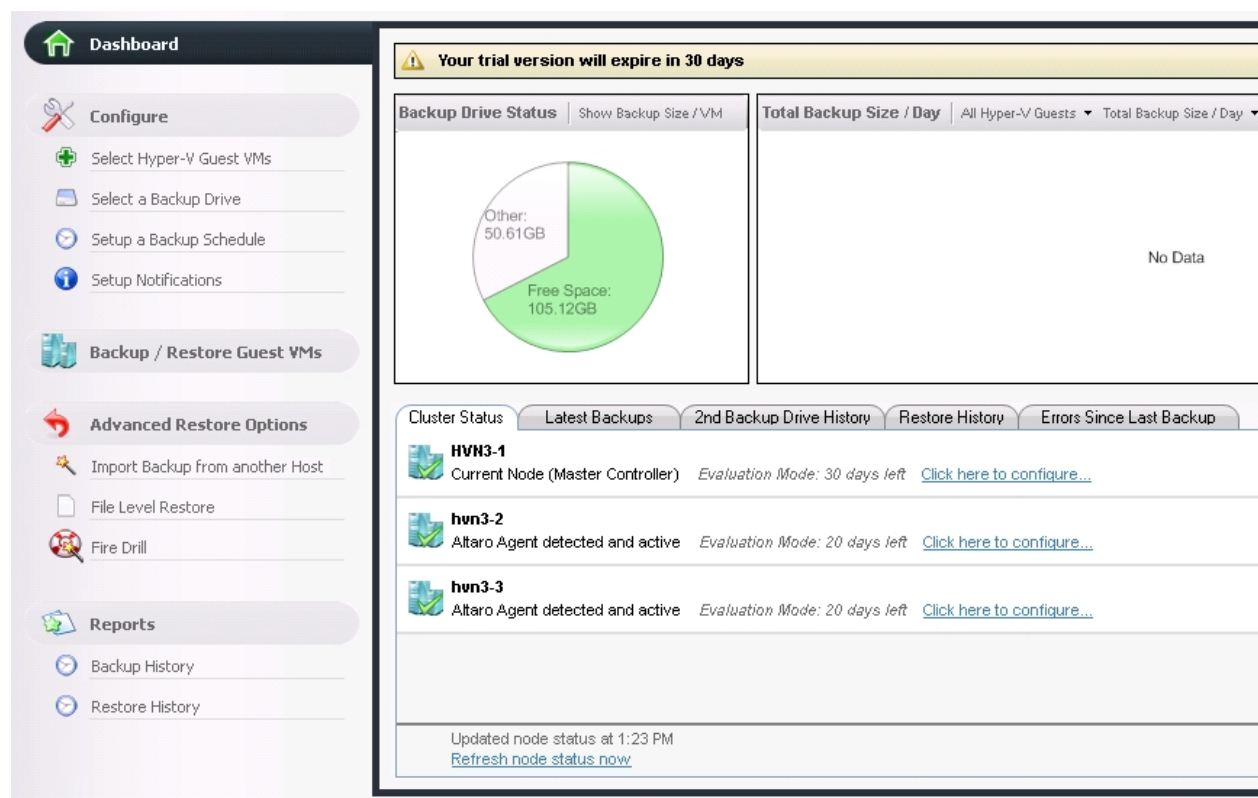

[Choosing which Guest VMs to backup within a Hyper-V Cluster Environment](#)

[Configuring a Backup Drive in a Hyper-V Cluster Environment](#)

Dashboard Cluster Status Tab

When running Altaro Hyper-V Backup in a Cluster Environment a new tab will appear within the Dashboard Screen.

Cluster Status Tab

The Cluster Status Tab will show a list of nodes on the cluster. The cluster status is refreshed every 5 minutes automatically, but a refresh can be forced by clicking on the "Refresh node status node" button. The following information is shown alongside each node:

- The **Name** of the node
- The **Status** of the Altaro Agent on that node:
 - Altaro Agent not detected.
 - Altaro Agent detected but must be upgraded to a newer version.
 - Altaro Agent detected and active.
 - Altaro Agent detected but is running as a Master Controller. This means that it cannot be configured from the current node. Click [here](#) to learn more.
- The **Evaluation Details** of the Altaro Agent on that node: (if the agent is currently within Evaluation mode)
 - Number of days left for evaluation.
 - Whether the evaluation period has expired or not.

- Whether the selected license key includes support for Cluster Environments.

- A **"Configure Button"**:

- Can be used to configure / update / install / uninstall the Altaro Agent upon that node.
- Can be used to license the Altaro Agent upon that node.

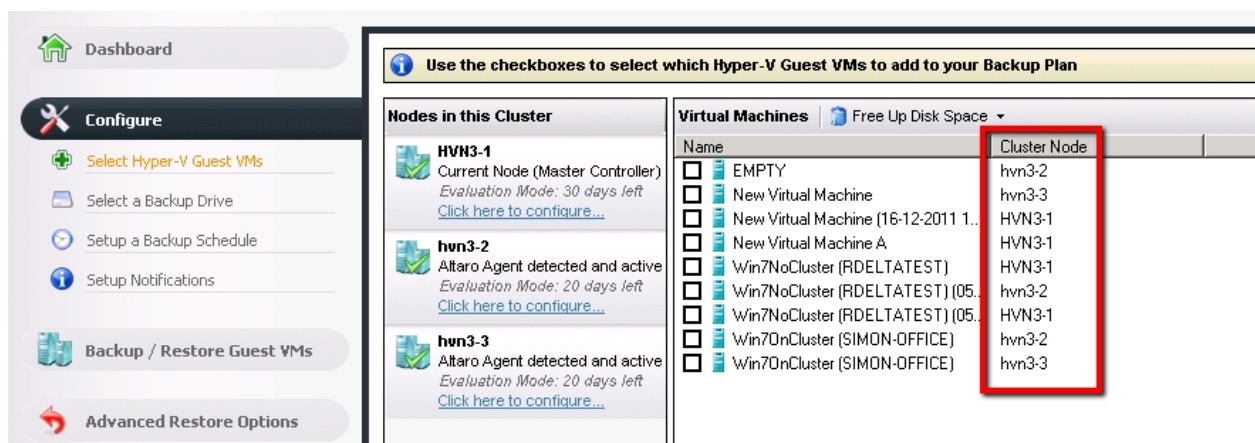

Click [here](#) to read more about configuring agents.

Selecting VMs for backup (Cluster Environment)

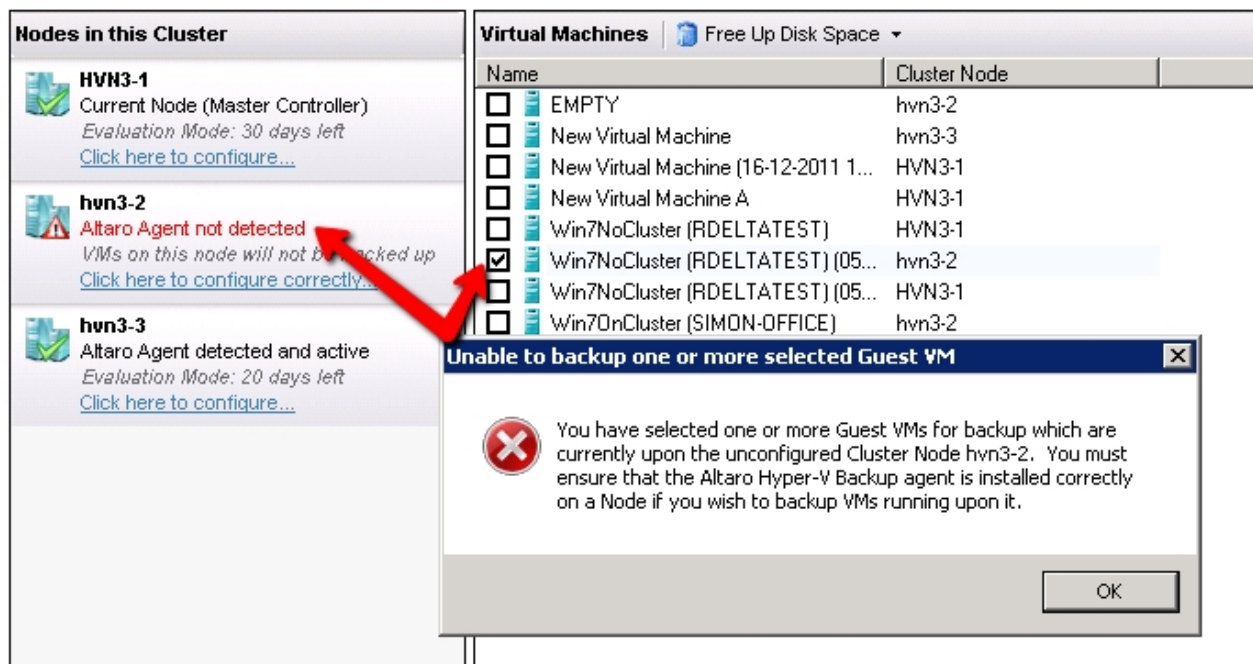

When selecting which Hyper-V Guests to add to your backup plan within a Hyper-V Cluster Environment an additional panel is displayed. This panel displays a list of nodes on the cluster and indicates the status of the Altaro Background Agent on each node.

The Hyper-V Guest VM list will now show all VMs available on the Cluster (including those that are not on the current node). An additional column will appear to show which node the VM is currently running upon. You can add any VM from any Node on the Cluster to your backup plan.

Before proceeding read the chapter on [Choosing which VMs to backup](#).

If a Background Agent on a specific node is not configured correctly then you will be unable to choose VMs from that node for backup. To configure the node correctly click on the button "[Click here to configure correctly...](#)".

Selecting a Backup Drive (Cluster Environment)

To see how to select a backup drive please [read this chapter](#). This article will describe an additional step which is required when selecting a backup drive in a Cluster Environment.

Also please note that [special considerations](#) must be taken when selecting a backup drive in a Cluster Environment.

Configuring the Altaro Agent upon a Node

At any point you may choose to configure an Altaro Agent upon a specific node. Configuration options include:

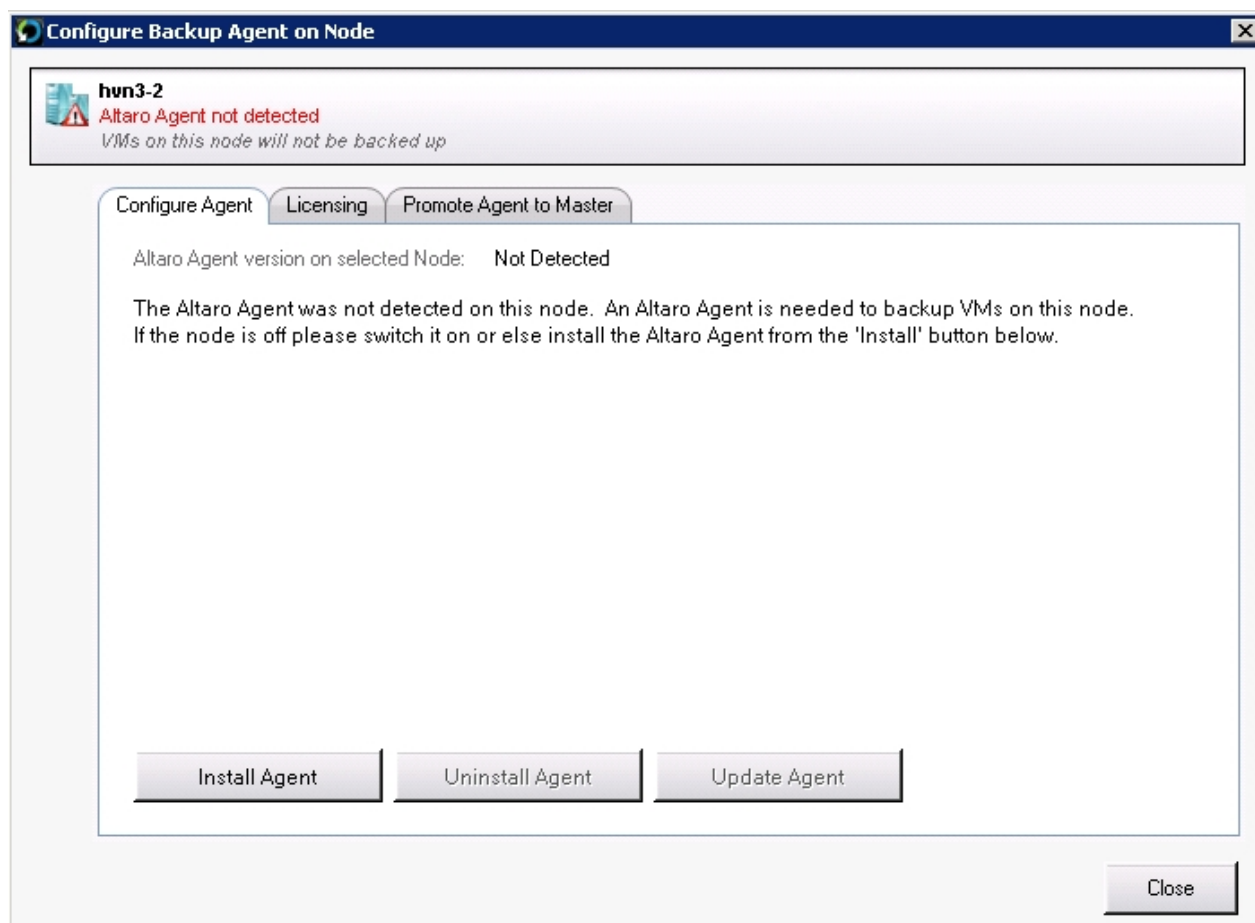

- Update / install / uninstall the Altaro Agent upon that node.
- Switch a node from a Master Controller to background agent.
- License the Altaro Agent upon that node.

To access the configuration panel simply use the [Dashboard Cluster Tab](#) and click on "Click here to configure..." besides the required Node.

Tab 1: Configure Agent

Three buttons are present at the bottom of the tab page:

- **Install Agent:** installs the Altaro Agent on the Node and configures it correctly.
- **Configure Agent:** switches a node from a Master Controller to background agent Node.
- **Uninstall Agent:** removes the Altaro Agent from the Node.
- **Update Agent:** Updates the Altaro Agent on the Node to the current Master Controller Version.

Tab 2: Licensing

This tab allows you to push a license key to the selected Node. Just click on the [Enter / View License Key] button and the following Window will appear which facilitates the licensing of each Node in the cluster. Simply use the checkboxes in the list to identify which Nodes you would like to license. The number of Nodes allowed is dependent on the number of activations allowed by the License Key.

Altaro Hyper-V Backup License Keys

HYPER-VBackup

ALTARO

License key valid for 1 node (Can be used for 1 additional node)

Enter License Key Here

Select which Nodes to license	License Status
<input type="checkbox"/>  HVN3-1	Licensed using different License Key
<input type="checkbox"/>  hvn3-2	Licensed using different License Key
<input type="checkbox"/>  hvn3-3	Licensed using different License Key

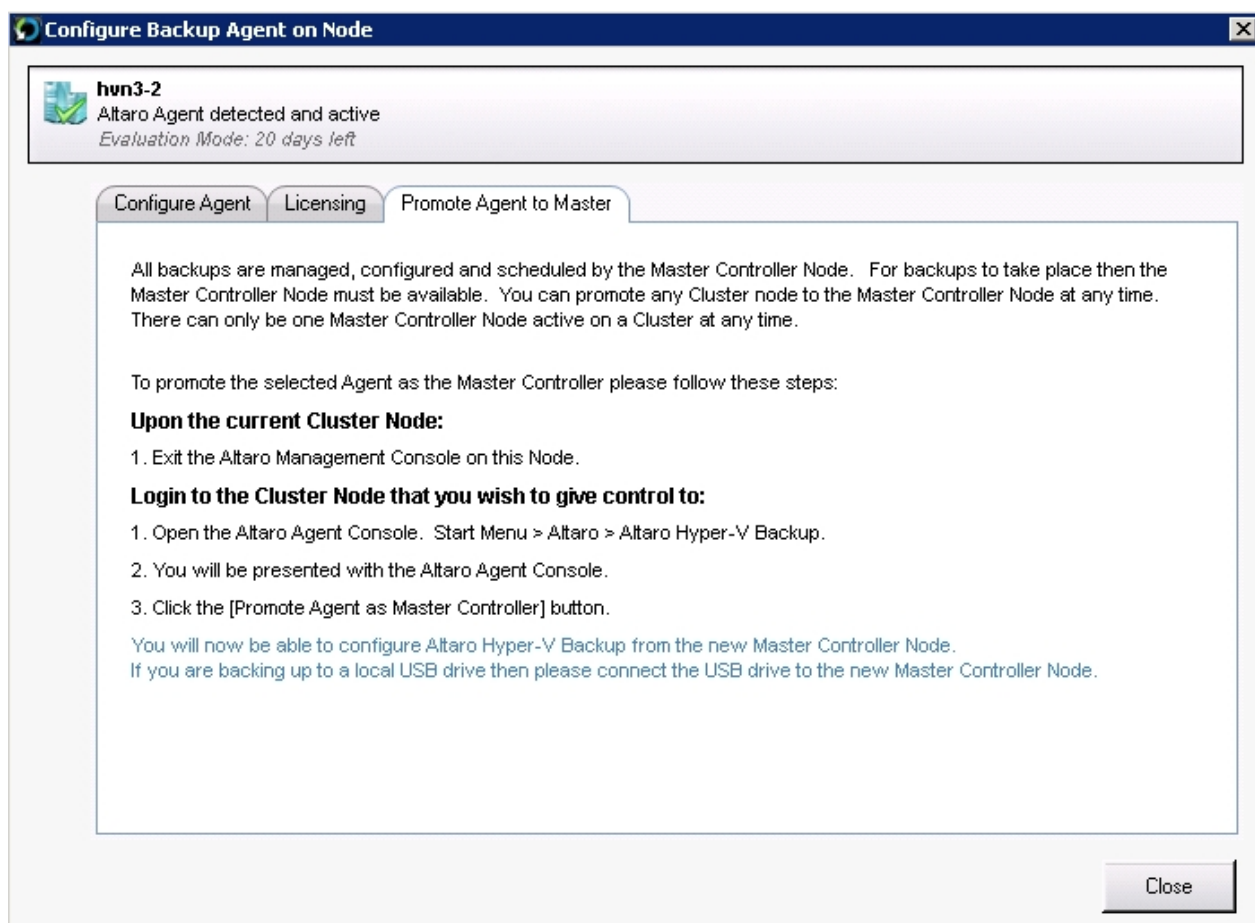

Each license key activation is logged through a call to our Web Service. No personal information is logged. If you do not have an internet connection you can still enter your license key and the activation will be logged later.

License Selected Nodes

Cancel

Tab 3: Promote Agent to Master

This tab simply provides instructions on how to promote the selected Agent as a Master Controller. Click [here](#) for instructions on how to do this.

Other considerations when using Altaro Agents

[Altaro Agent User Interface](#)

[Promoting an Altaro Agent as the Master Controller](#)

Altaro Agent User Interface

As discussed earlier in this section the Management Console can only be accessed from the Master Controller Node. Attempting to launch the Management Console from other nodes will only launch a simple Status Console as shown below.

To launch the Agent Console please use one of the following methods:

- Clicking on the **Altaro Hyper-V Backup** item within the "Start Menu > All Programs > Altaro" group.
- Launching "Altaro Hyper-V Backup.exe" application from the install location. By default this is "C:\Program Files\Altaro\Altaro Hyper-V Backup".
- Enter the command **STARTALTARO** into a command prompt window. This may not work immediately after first install until you log out and in to the Server due to the Environment Variables not being refreshed.

This console mainly provides status information but allows for the following:

- Entering a License Key.
- Checking for Software Updates.
- Accessing the User Guide.
- Stopping / Starting the Agent Windows Service.
- [Promoting the Agent as the new Master Controller.](#)

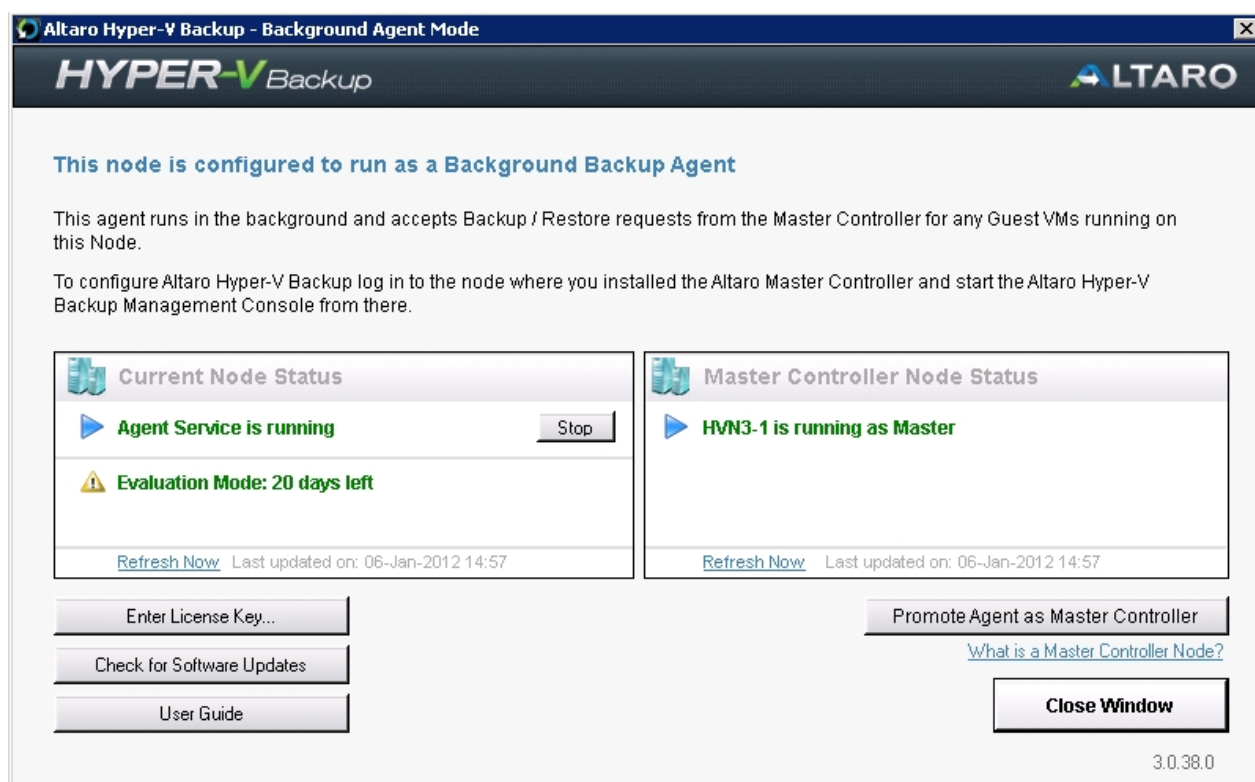

Promoting an Altaro Agent as the Master Controller

Please Note: Before reading this article it is important to understand the difference between a Master Controller Node and a Background Altaro Agent. Click [here](#) to read more on this [topic](#).

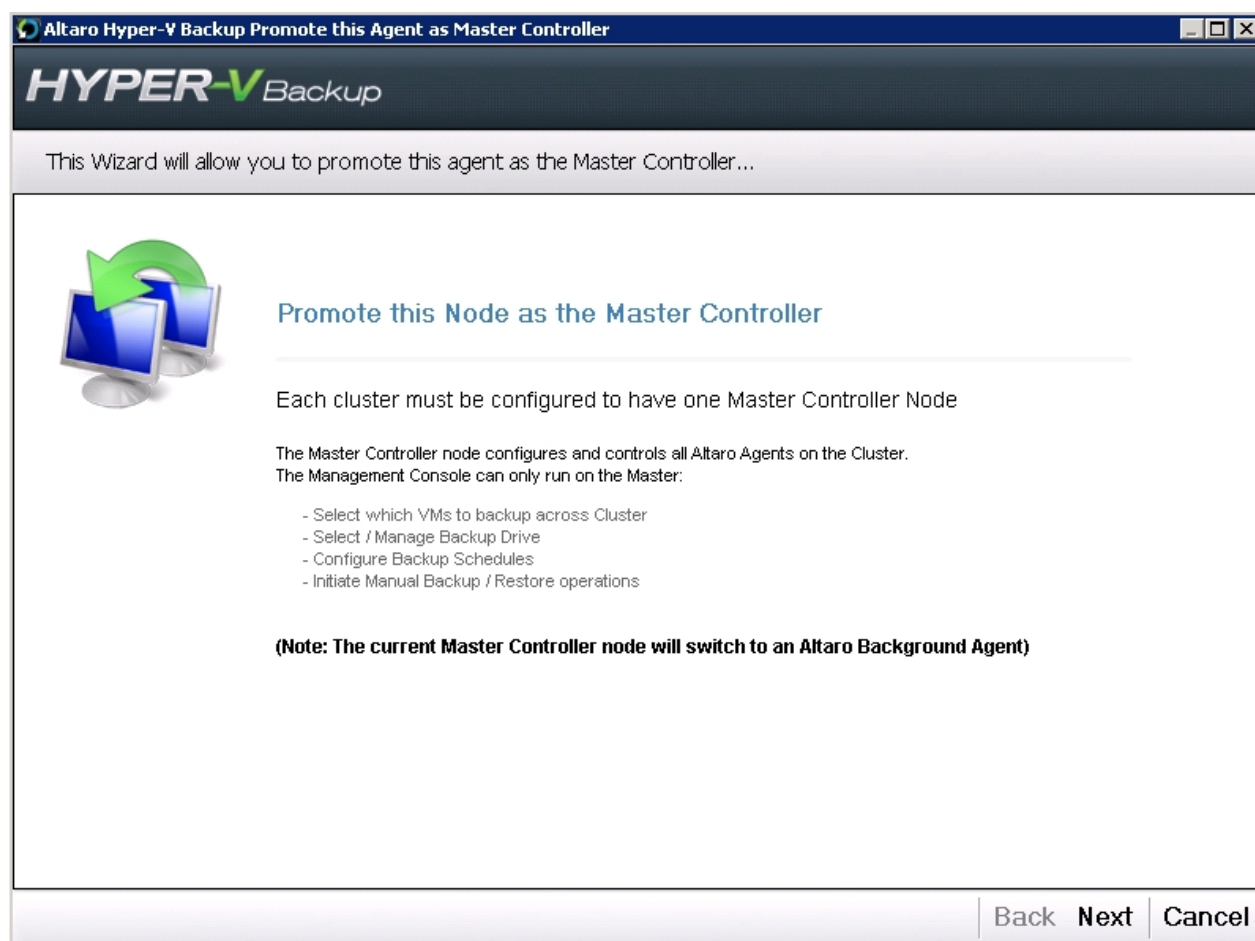

If you wish to promote a node to the Master Controller you must open the Agent Console using one of the following methods:

- Clicking on the **Altaro Hyper-V Backup** item within the "Start Menu > All Programs > Altaro" group.
- Launching "Altaro Hyper-V Backup.exe" application from the install location. By default this is "C:\Program Files\Altaro\Altaro Hyper-V Backup".
- Enter the command **STARTALTARO** into a command prompt window. This may not work immediately after first install until you log out and in to the Server due to the Environment Variables not being refreshed.

Once launched you will see the following screen:

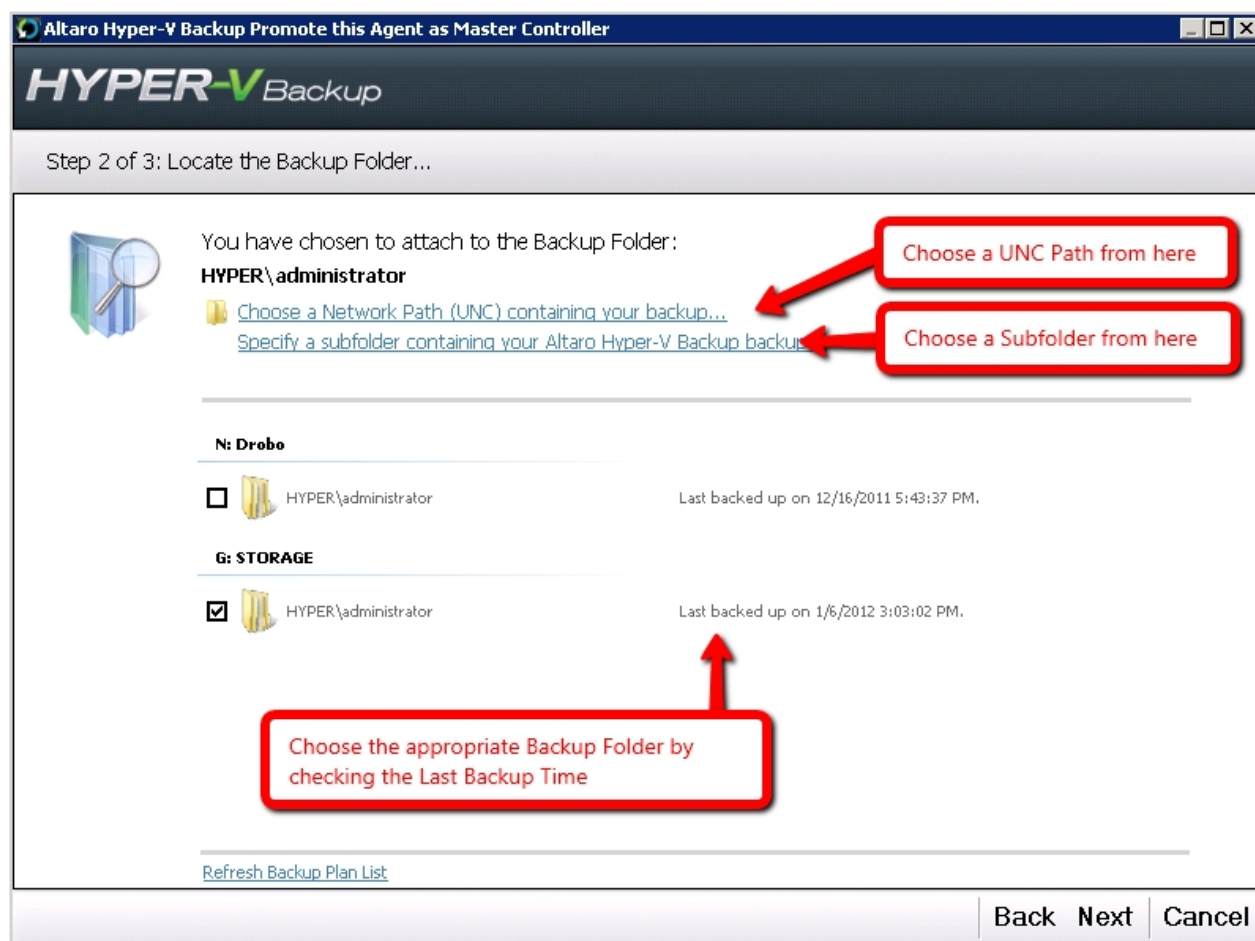

1. Click on "Promote Agent as Master Controller" to begin. The first screen that will appear is simply an information screen explaining what a Master Controller node does. Promoting an agent will demote the previous Master Controller.

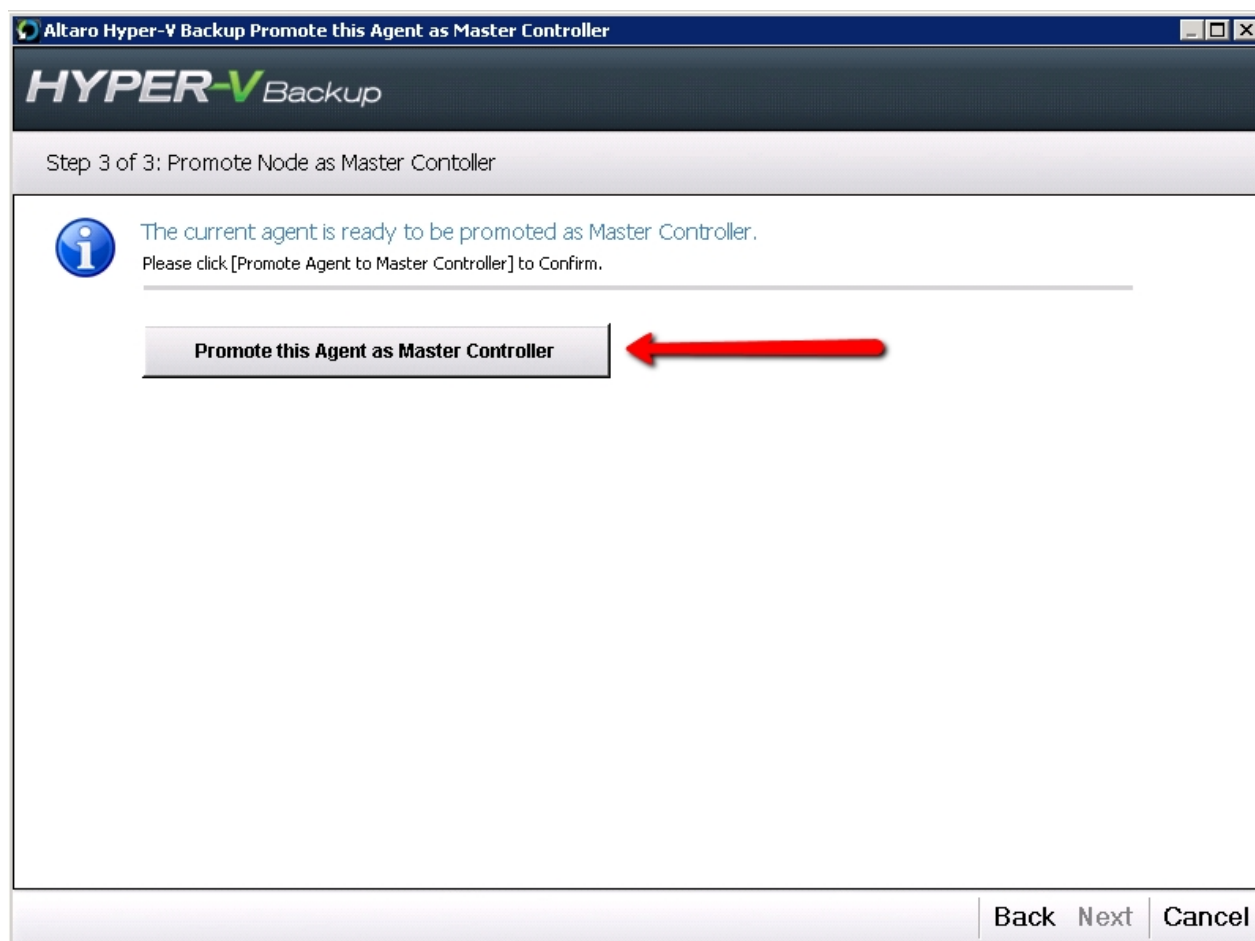

2. The next step is to select the backup folder currently being backed up to by the old Master Controller.

- Only backup folders of the same Cluster will be displayed.
- You may choose to attach to a UNC Path.
- You may choose to connect the backup drive directly to the new node.
- If you do not find the backup folder, click on "Specify a subfolder..." to choose the parent folder of the **AltaroHyperVBackup** folder which contains the backup files.
- You can check the "Last Backup Time" to ensure that you are attaching to the correct folder.

3. Confirm that you would like to promote the agent as Master Controller. Once again please note that the previous Master Controller will be demoted to a background Altaro Agent. If the old Master Controller node is currently offline / unavailable then it will be demoted the next time it starts or connects to the backup drive.

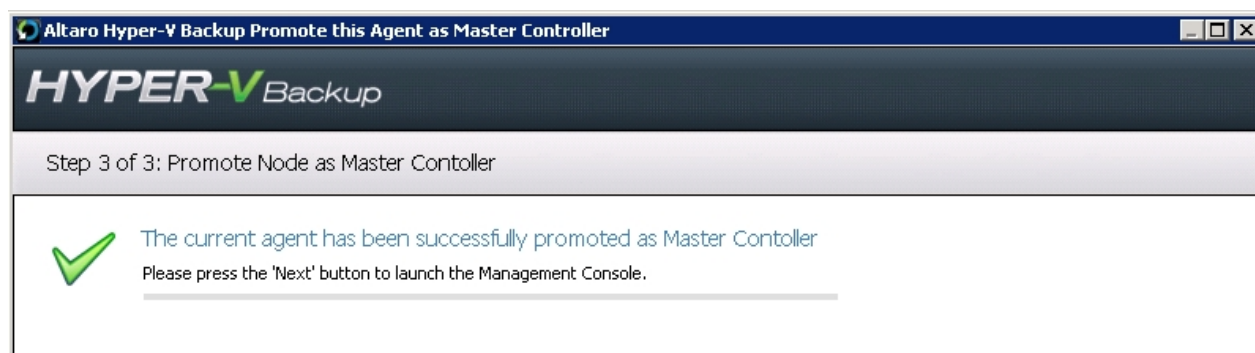

4. The operation will begin and a progress bar will show the current action. This may take a few minutes.

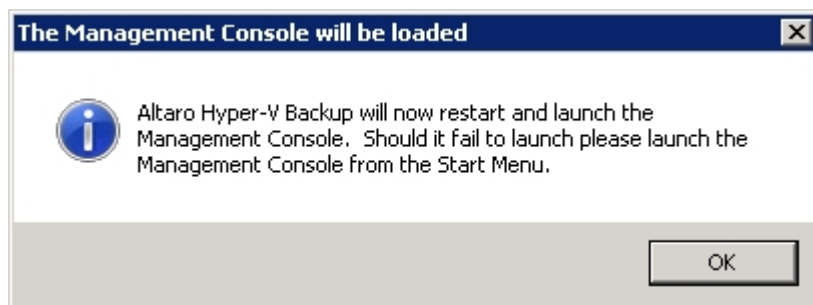

5. Once the promotion is completed the progress bar will be replaced by a message. It can either be successful as displayed in the example below or an error could be listed. In the case of an error please refer to the error message, resolve the issue and try again.

An example of an error is that the current Master Controller node is currently busy taking a backup - in that case promotion of other nodes is not allowed.

6. Finally if the promotion was successful the the Managment Console will be launched. It is possible that the Management Console will not start automatically. If not please launch it manually from the Start Menu.

Firewall Rules / Communication between Nodes

It is important to note that Altaro Hyper-V Backup performs the following IPC and TCP communication:

1. Within the same Node

- Between the Management Console and the "Altaro Hyper-V Backup" Windows Service.

IPC Ports used

2. Between Nodes on the same Cluster

- Between the local Management Console and the "Altaro Hyper-V Backup" Windows Service on the remote node.

TCP Port: 24252

- Between the "Altaro Hyper-V Backup" Windows Service and the "Altaro Hyper-V Backup" Windows Service on the remote node.

TCP Port: 24251

To facilitate this communication the Altaro Hyper-V Backup Windows Installer create the Windows Firewall rules below which allow communication between the following processes:

- Altaro Hyper-V Backup.exe
- Altaro.HyperV.ServiceEngine.exe

Understanding Altaro Hyper-V Backup

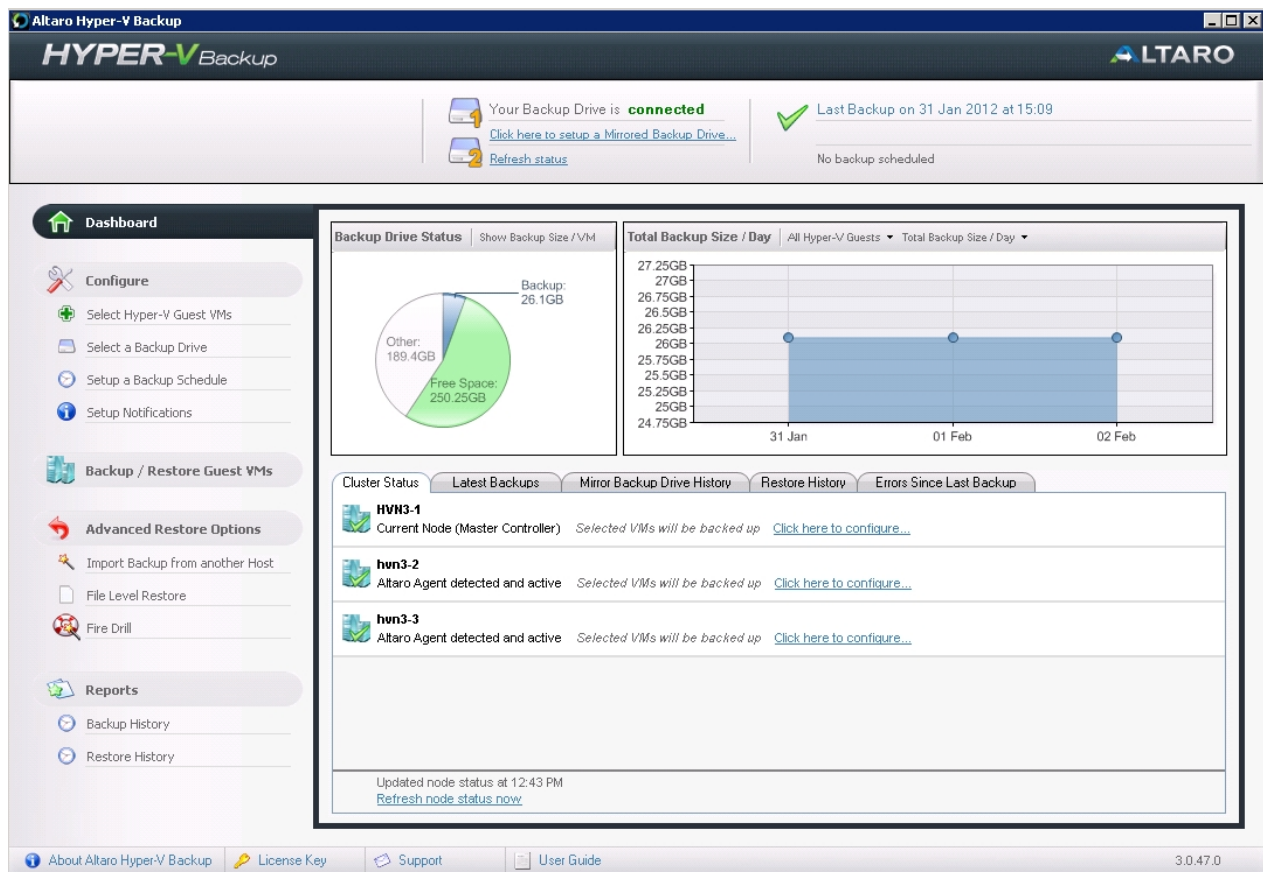

The Altaro Hyper-V Backup program is made up of four main components:

- The Altaro Hyper-V Backup Management Console
 - User interface for users to interact with Altaro Hyper-V Backup.
 - Read more [here](#).
- The Altaro Hyper-V Backup Service
 - a Windows Service that runs in the background and is responsible for backup, restore and maintenance operations.
 - Read more [here](#).
- The Altaro Hyper-V Backup Service Controller Console
 - User interface for users to stop and start the service and to discard and restart their backup plan.
 - Read more [here](#).
- The Altaro Hyper-V Backup Error Reporter
 - User interface for users to build an error report which automatically collects all necessary logs and configuration files. The user can then send the error report by email.
 - Read more [here](#).

In this section a brief overview of each component will be given. The overview will focus on the user interface layout of each one. More details of their features will be given in upcoming sections.

Management Console Workspace

To learn how to access the **Management Console** please read this [tutorial](#).

The Manager window has the following layout:

- **Top Banner:** The top banner simply displays the product logo.
- **Top Status Bar:** This bar is divided into two sections:
 - **Section 1:** The primary and secondary backup drive status is shown here. The primary backup drive is also displayed as connected or disconnected.
 - **Section 2:** Here the last backup status is shown. If you have configured a secondary backup drive then the time stamp of the last synchronization between backup drives is shown too. Finally the number of pending changes for backup and the estimated time to the next backup is shown.
- **Left Hand Side Menu:** This menu allows users to Navigate to each section of the Management Console. Upon clicking on a section it will be displayed in the main panel at the center of the Manager screen. The available sections are:
 - **Dashboard:** This panel is selected by default and presents backup statistics and logs. These include the status of the latest backups, a restore history, current backup size etc.
[A more detailed explanation of the dashboard can be found here.](#)
 - **Configure:** From this panel the user can change settings related to the backup such as which VM's to backup, which drive to backup to and what notifications to receive.

[More information related to configuration can be found here.](#)

- **Backup and Restore:** The main backup and restore operations can be managed from here:

- Backup / Restore Hyper-V Guest VMs - take manual backups, restore and configure backup settings for each VM.

[More information can be found here.](#)

- **Advanced Restore Options:** All backup and restore operations can be managed from here:

- File Level Restore - restore individual files or folders from a VM Backup.
 - Import Backup from another Host - have access to the backup drive of another Hyper-V Host? You this feature to import a VM backup from another host.
 - Fire Drill - verify your VM Backups.

[More information can be found here.](#)

- **Reports:** Three detailed reports can be found in this section. These are made up of:
 - *Backup History* – a list of all backups including their status and the files that were changed during each backup. The amount of data transferred during each backup and the duration of the backup is also listed here.
 - *Restore History* – a list of all restore operations including their status. The duration of the operation is also listed here.
 - *Errors Since The Last Successful Backup* - errors which occurred during the last failed backup are listed here. Once the VM is successfully backed up then the error list for that folder is cleared.

[More information can be found here.](#)

System Tray Icon

The System Tray icon and Context menu

When the Management Console is running in the background you will notice that an icon has appeared within your Windows Server system tray.

Icon States:

- **Rotating:** This indicates that Altaro Hyper-V Backup is busy performing a backup or restore operation.
- **Alert Icon:** This indicates that an unresolved error has occurred since the last successful backup.
- **Standard:** This indicates that Altaro Hyper-V Backup is idle. At this point it is simply monitoring file changes and waiting for the next scheduled backup.

Right-Clicking on the system tray icon will bring up the following context menu:

The context menu provides the following options:

- **Manage:** This option will bring up the Management Console window.
- **Backup a Hyper-V Guest VM:** This option will take you to the Backup / Restore screen of the Management Console.
- **Restore a Hyper-V Guest VM:** This option will take you to the Backup / Restore screen of the Management Console.
- **Disable / Enable Backup Schedules:** This option will disable / enable the backup schedule for all VMs.
- **Enter your License Key:** A window will appear to allow you to paste your license key which you received upon purchase of the software.
- **Check For Online Updates:** This option will connect to the Altaro software update server and check whether any newer critical updates are available. It is important to note that newer versions may be available from the Altaro website even if this option indicates that there are no newer versions.
- **Other Settings:** Here additional settings can be configured without having to open the Manager

window.

- **Close Management Console:** Closing the management console will simply exit the user interface and remove the system tray icon. The Altaro Hyper-V backup service will continue to run in the background and any scheduled backups will continue to take place.

Double-Clicking on the system tray icon will bring up the **Management Console**. This will be described in more detail in the next section.

Service Controller

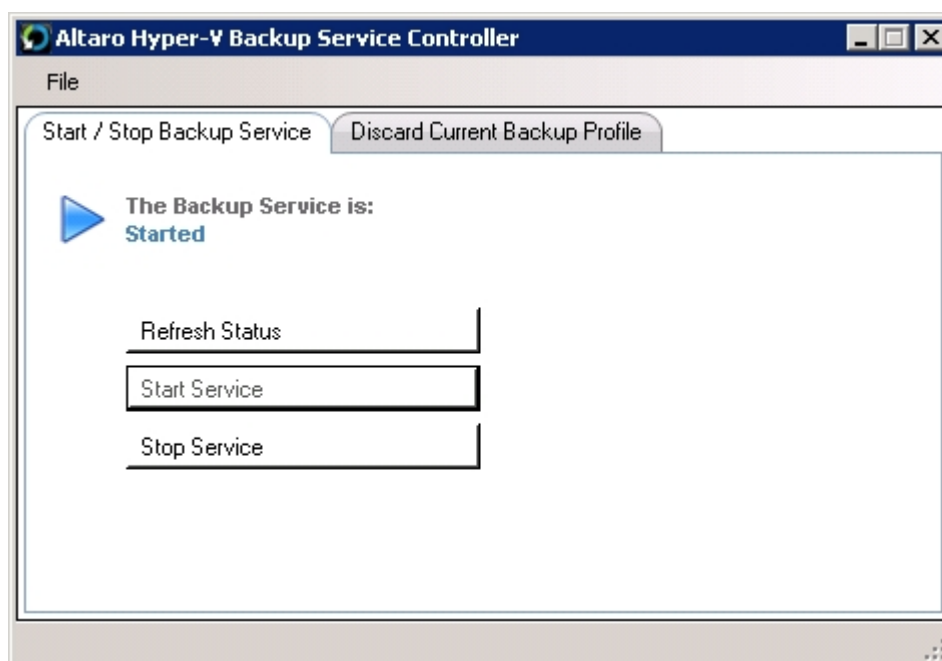

In **Altaro Hyper-V Backup** the user interface runs separately from the Backup Engine. The Backup Engine is deployed as a Windows Service and runs in the background. The Backup Engine Service performs the following operations:

- Backup schedules
- Backup operations
- Restore operations
- Scanning of backup folders for file changes
- Synchronization of the primary and secondary backup drives
- Sending of email backup reports and event log notifications
- Maintenance of old versions.

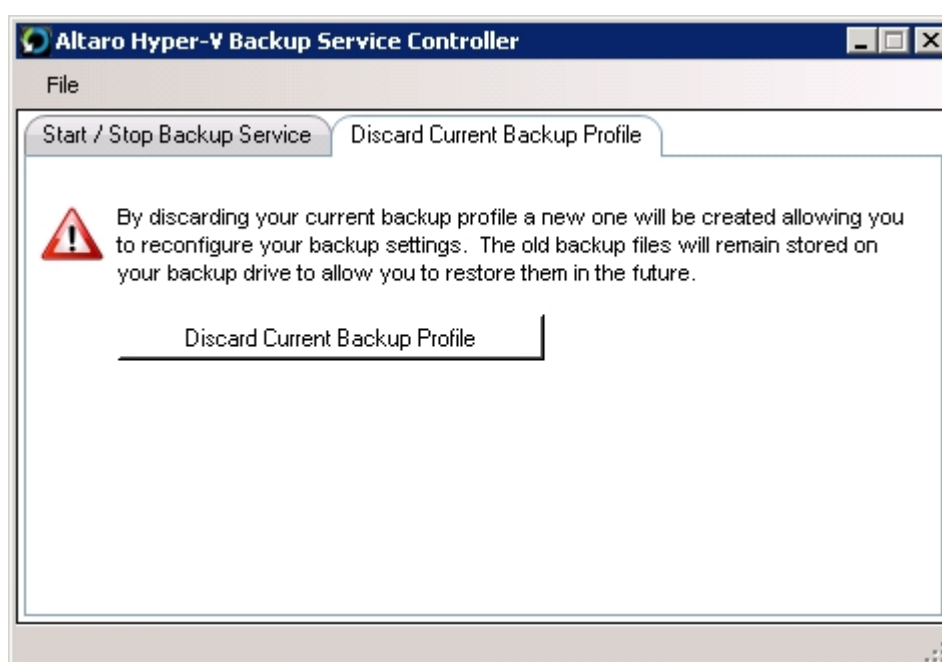

Should the user require stopping or starting the backup engine the service controller should be used. This application can be found within the Altaro Start Menu folder.

The interface of the service controller is made up of three tabs:

- **Start / Stop Backup Service:** This tab contains three buttons.
 - *Refresh:* updates the status of the backup engine.
 - *Stop:* stops the windows service from running. The service will start again when Windows is restarted.
 - *Start:* starts the windows service.

- **Discard Current Backup Profile:** This tab allows the user to discard the current backup profile and start a new one. Once the old backup profile is discarded, Hyper-V Backup can be reconfigured using the Management Console as described [here](#).

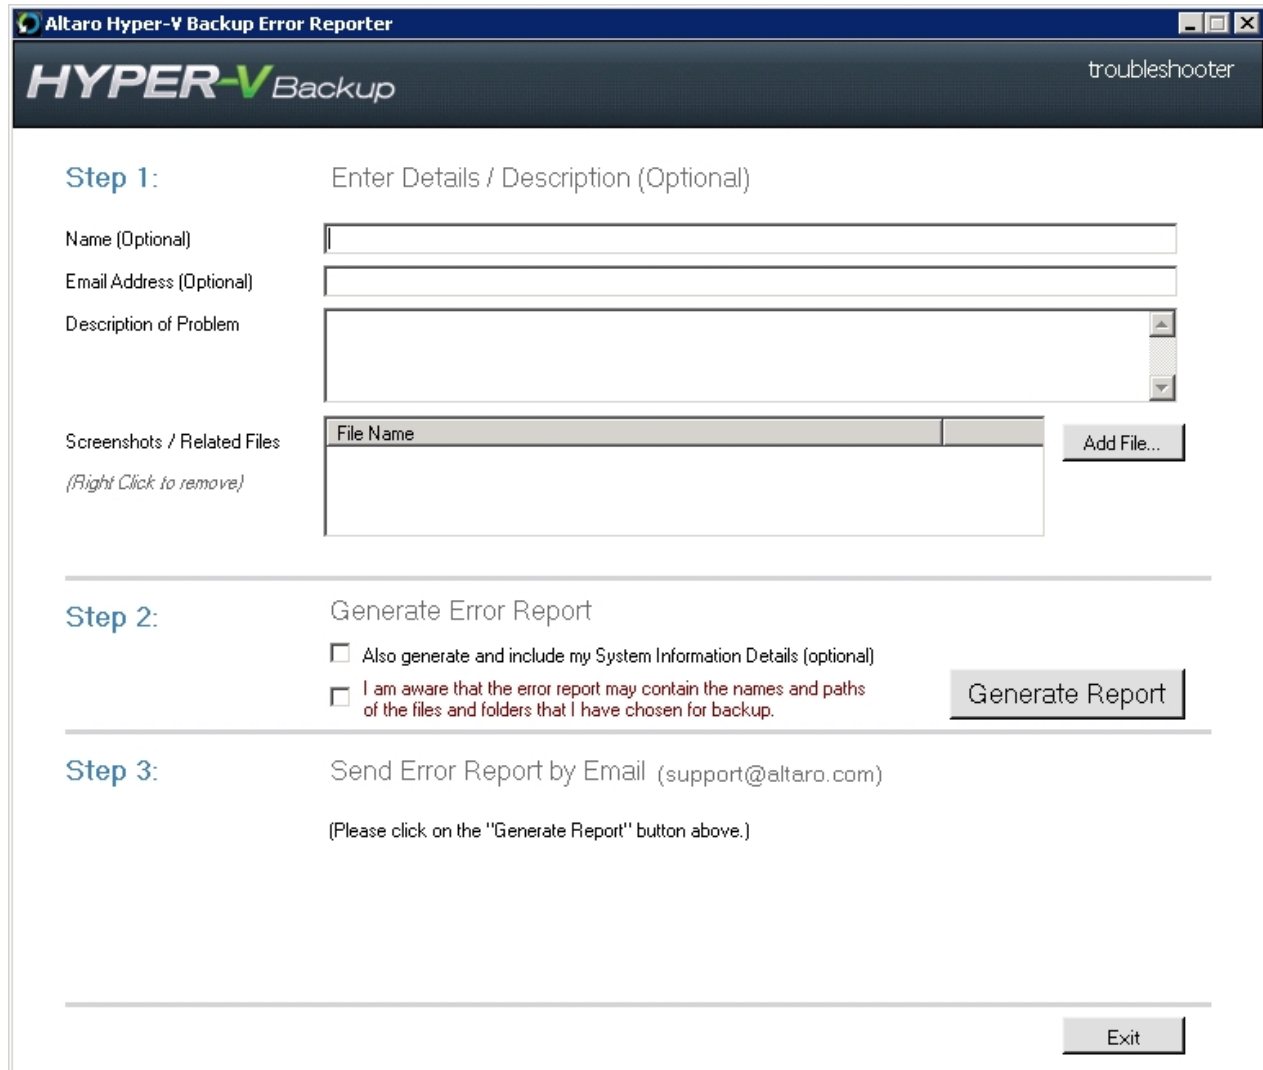

- **Switch to secondary backup drive:** This tab allows the user to switch to secondary backup drive as described [here](#).

Error Reporter

The **Error Reporter** can be found in the Start Menu > All Programs > Altaro program group.

Once opened simply enter the error details, check the disclaimer check box and press generate. Next simply email the generated error report to Altaro.

The image shows a software window titled "Altaro Hyper-V Backup Error Reporter". The window has a dark blue header bar with the "HYPER-V Backup" logo on the left and the word "troubleshooter" on the right. The main content area is divided into three steps:

Step 1: Enter Details / Description (Optional)

This step contains four input fields:

- Name (Optional): A single-line text box.
- Email Address (Optional): A single-line text box.
- Description of Problem: A multi-line text area with up and down arrow buttons on the right.
- Screenshots / Related Files: A table with one header row "File Name" and one empty data row. Below the table is the text "(Right Click to remove)". To the right of the table is an "Add File..." button.

Step 2: Generate Error Report

This step contains two checkboxes:

- ☐ Also generate and include my System Information Details (optional)
- ☐ I am aware that the error report may contain the names and paths of the files and folders that I have chosen for backup.

To the right of these checkboxes is a "Generate Report" button.

Step 3: Send Error Report by Email (support@altaro.com)

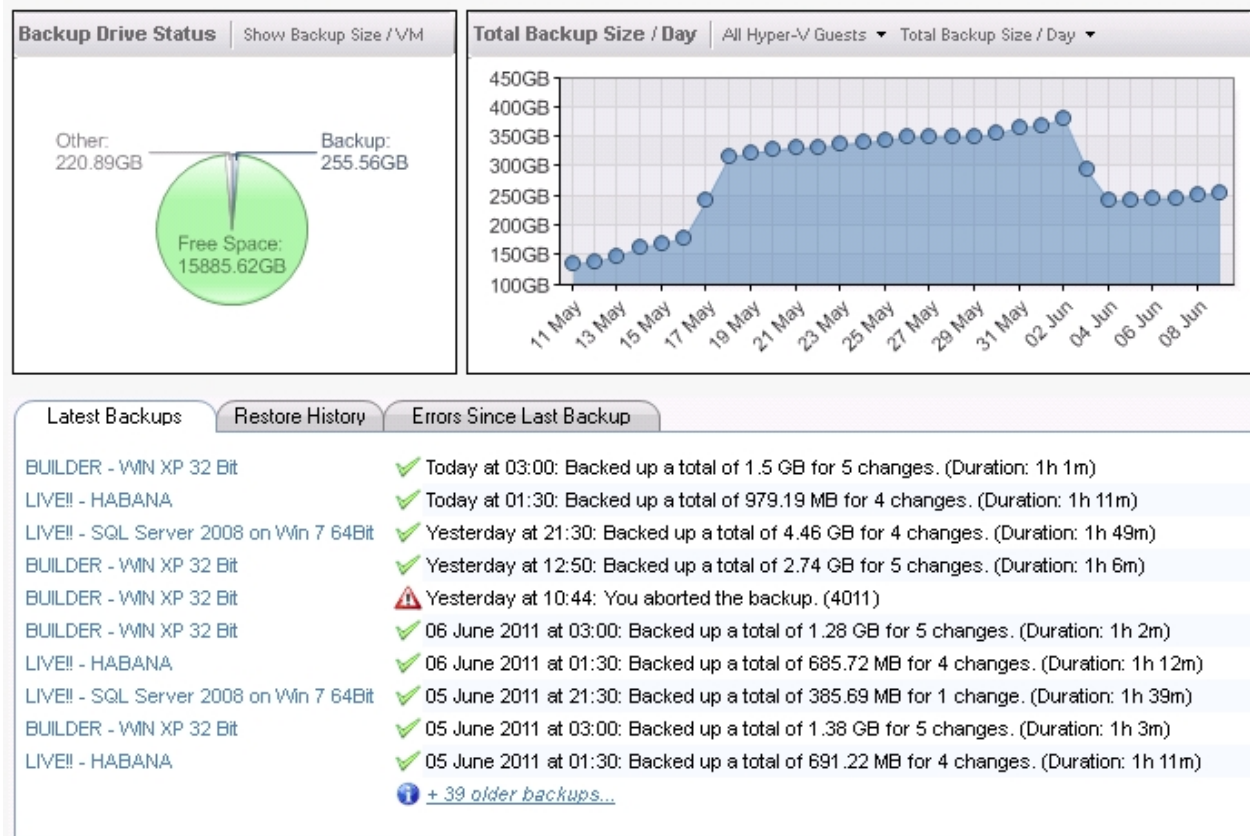

Below the step title is the text: "(Please click on the "Generate Report" button above.)"

At the bottom right of the window is an "Exit" button.

Dashboard

You can view the dashboard by opening the **Management Console**. Read [here](#) for instructions on how to do this.

- [Charts & Statistics](#)
- [Backup History](#)
- [Restore History](#)
- [Errors since the last backup](#)
- [Cluster Status Tab](#)

Charts & Statistics

The top half of the dashboard displays a number of charts and statistics. The following charts are available:

- **Backup Drive Status:**
 - A pie chart displaying space used by your backup, other files and the remaining free space.
 - A pie chart displaying percentage of space allocated to each backup folder selected. Click on [Show backup Size/VM] to toggle this chart.
- **Backup Trends:** By default the graph displays the trend for all VMs, but a drop down list is available to view the trend for each VM separately.
 - A line chart displaying the total backup size / day.
 - A bar graph displaying the average backup duration / day.
 - A bar graph displaying the total data transferred / day.
 - A line chart displaying the total number of backups / day.

List of Latest Backups

In the bottom half of the Dashboard you will find a tab control with three reports.

The first tab displays a list of the latest backups. The following information is displayed:

- The VM name that was backed up.
- Date and time of the backup.
- The backup status indicating whether the backup succeeded, succeeded with skipped files, or failed.

- The number of files backed up.
- The total size of the data that was backed up.
- The duration of the Backup.

View List of Skipped Files

Double-clicking on a backup which has a warning icon or error icon will bring up a list of files that were skipped during that backup. A reason why the file was skipped is also given.

View List of Backed up Files

Double-clicking on a successful backup will bring up a list of files that were backed up during that backup. Information on whether the file was created, changed, renamed or deleted is also given.

Alternatively you may right-click on a backup to bring up a context menu with all options.

View a Report of all older backups

This list will only display the most recent backups. At the bottom of the list you will find a link to view the complete backup history report.

List of Latest Restores

In the bottom half of the Dashboard you will find a tab control with three reports.

The second tab displays a list of the latest restore operations. The following information is displayed:

- The VM name that was restored.
- Date and time of the restore operation.
- The restore status indicating whether the restore operation succeeded or failed.
- The duration of the restore operation..

View a Report of all older restore operations

This list will only display the most recent restore operations. At the bottom of the list you will find a link to view the complete restore history report.

List of Errors since Last Backup

The third tab displays a list of any errors that have occurred since the last successful backup. The following information is displayed:

- Date and time of the error.
- A description of the error.
- The error code.

This list will be cleared once the VM causing the error is backed up successfully.

Cluster Node Status Tab

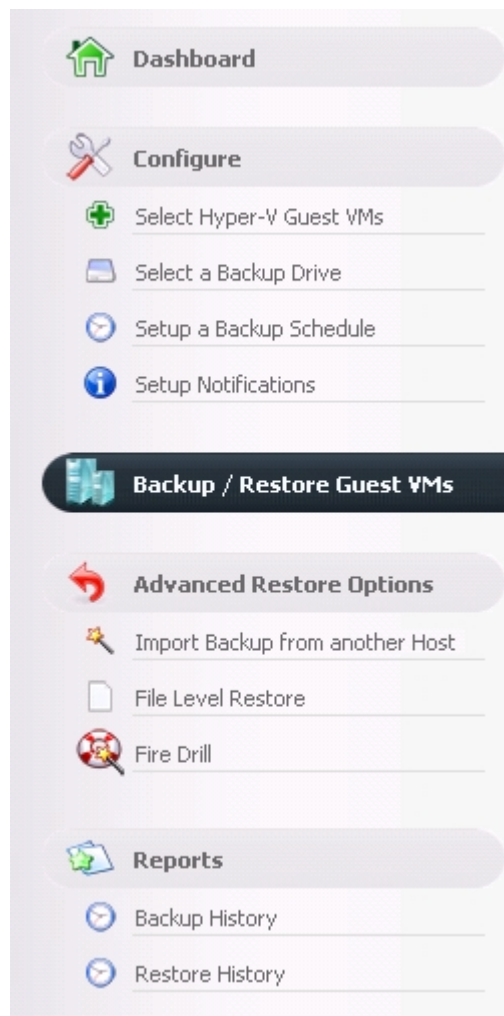

Click [here](#) to read more about the Dashboard Cluster Node Tab.

Backup & Restore

Access to the Backup & Restore section of the Management Console can be achieved as follows:

This can be achieved by following these steps:

1. Open the **Management Console** as described [here](#).
2. Navigate to the "**Backup and Restore**" menu item at the left hand side of the screen.

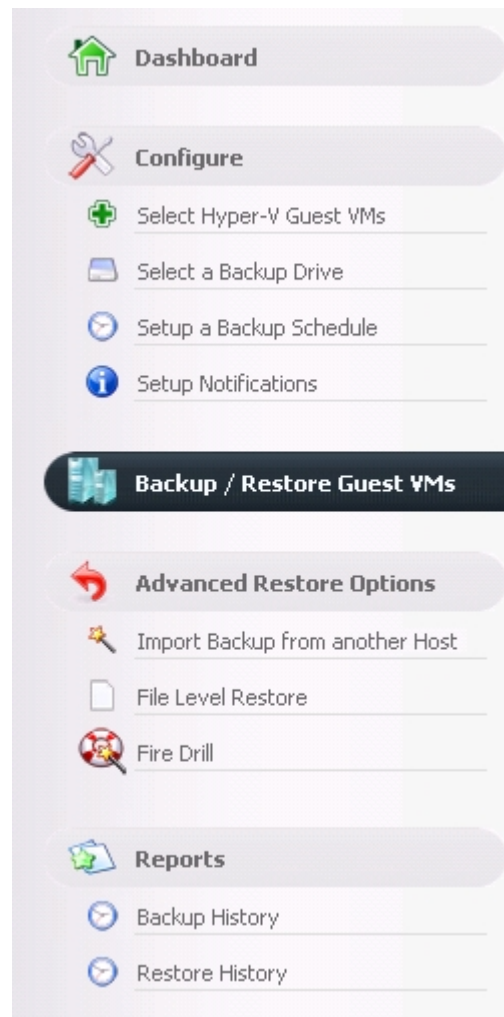

Backup Settings

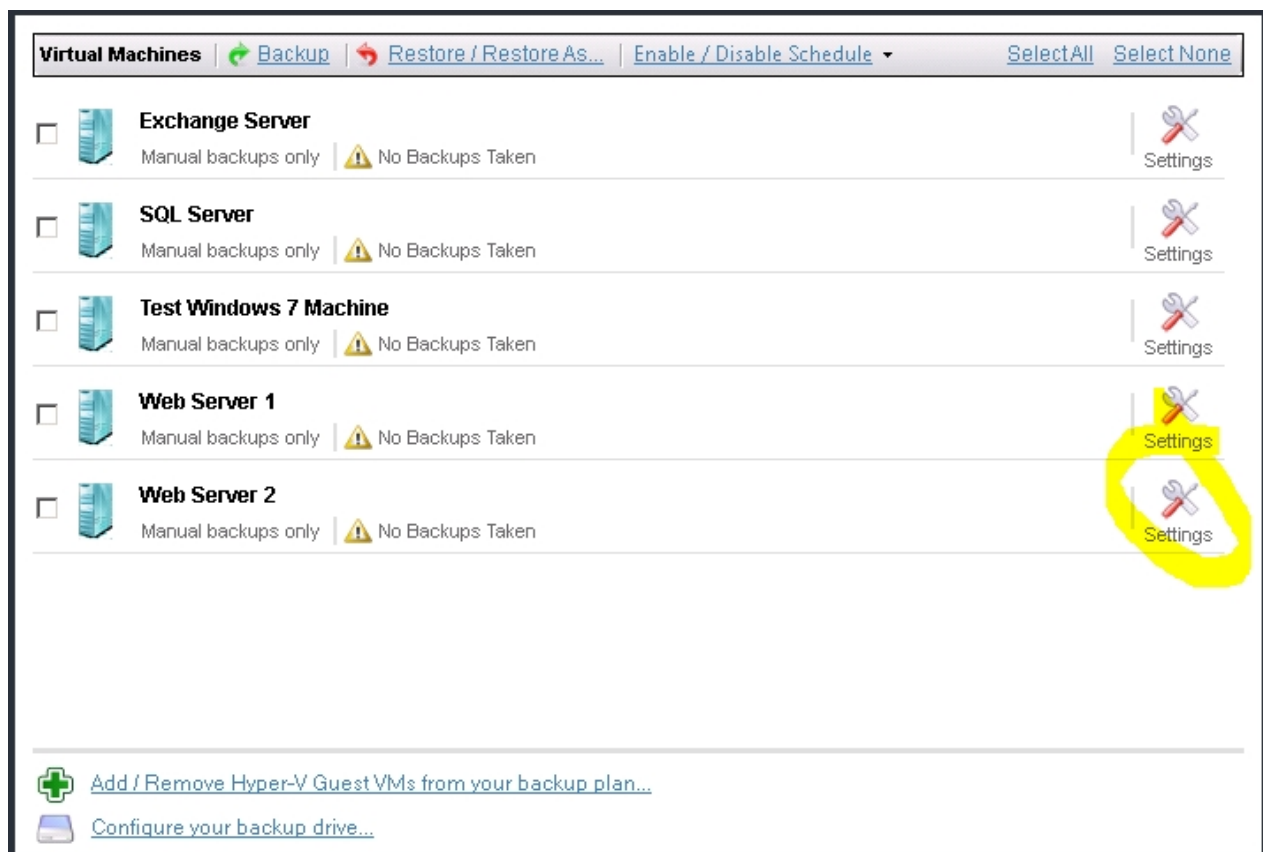

Modifying Backup Settings for a VM is simple and can be achieved by navigating to the "Advanced Settings" window of each Guest VM.

This can be achieved by following these steps:

1. Open the **Management Console** as described [here](#).
2. Navigate to the "**Backup / Restore Hyper-V Guest VMs**" screen.

3. You will be presented with the following screen. Please note the "Spanner and Wrench" icons to the right hand side of each VM.

4. Clicking on a "Spanner and Wrench" icon will display the "Advanced Settings" window for the VM in question.

5. From the advanced settings Window you can do the following:

- Enable / Disable Reverse Delta. Click [here](#) for more details.
- Choose how many versions to keep of the VM and choose a schedule for deleting old versions. Click [here](#) for more details.
- Choose whether to backup ISO files which are attached to the VM. Click [here](#) for more details.
- Choose whether to enable Live Backups for Non-VSS Aware Guests (Crash-Consistent Backups). Click [here](#) for more details.

Backing up Hyper-V Guest VMs

- [Scheduled Backups](#)
- [Manual Backups](#)
- [VM Live Backups](#)
- [Requirements for Live Backup](#)
- [ISO Backups](#)

Scheduled Backups

To configure automatic scheduled backups please setup schedule groups as explained [here](#).

Manual Backups

To take a manual backup first navigate to the **Backup / Restore Hyper-V Guest VM** screen as explained [here](#).

You will now be presented by this screen:

1. Select the VMs which you wish to backup now using the checkboxes to the left.
2. Click on the [Backup] button at the top of the panel and the selected VMs will be backed up.
3. You will know that a backup is taking place because the progress bar at the top right of the Management Console will be active.

VM Live Backups

Before a backup is started, Altaro Hyper-V Backup creates a Volume Shadow Copy on the host machine. During this stage, Altaro Hyper-V Backup integrates with the Microsoft Hyper-V VSS writer in order to

specify to the latter which virtual machines are about to be backed up.

In many cases, instead of saving the child VM while the shadow copy is being prepared, Hyper-V may use the VSS **inside the child VM**. This is called “cascading” the shadow copy or performing a “Child VM Snapshot”.

The advantage of this method is that VSS aware applications running within the child VM, such as databases etc., may also flush their data to the VHD into a consistent state before the backup is taken, and this may be done without stopping the child VM or any of its running services.

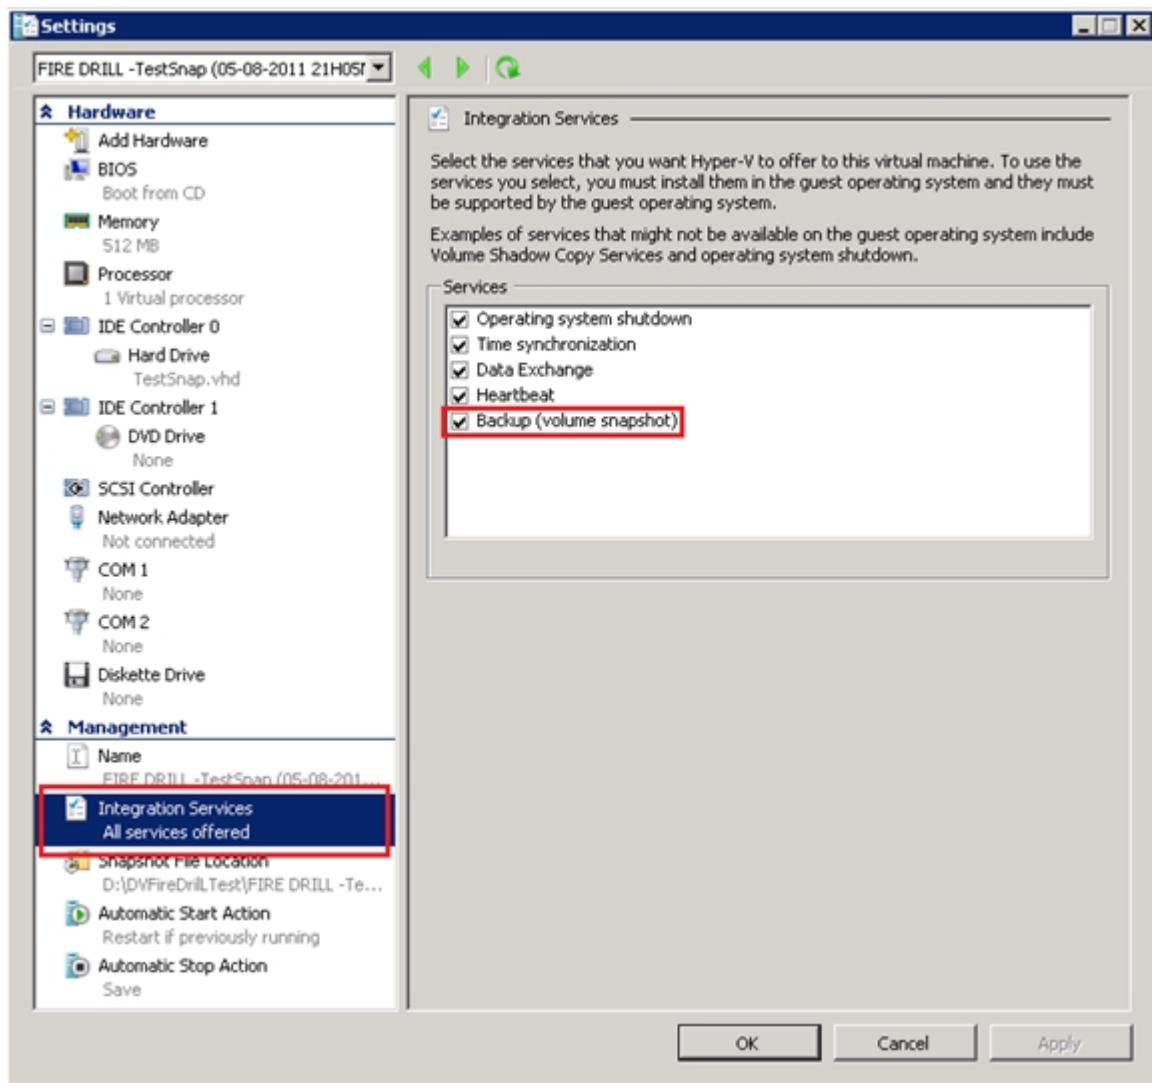

For this method to be supported, all of the following conditions must be met:

- Backup (volume snapshot) Integration Service is installed and running in the child VM. The service name is “Hyper-V Volume Shadow Copy Requestor”.

Windows 2000: *Backup Integration Service is not supported.*

- The child VM must be in the running state.
- The Snapshot File Location for the VM is set to be the same volume in the host operating system as the VHD files for the VM.
- All volumes in the child VM are basic disks and there are no dynamic disks.
- All disks in the child VM must use a file system that supports snapshots (for example, NTFS).

The following screenshot shows the settings of a VM within the Hyper-V management window. For child VM snapshots to be enabled, the Integration services option “Backup (volume snapshot)” must be enabled:

Requirements for Live Backups

- Backup (volume snapshot) Integration Service is installed and running in the child VM. The service name is "Hyper-V Volume Shadow Copy Requestor".
Windows 2000: Backup Integration Service is not supported.
- The child VM must be in the running state.
- The Snapshot File Location for the VM is set to be the same volume in the host operating system as the VHD files for the VM.
- All volumes in the child VM are basic disks and there are no dynamic disks.
- All disks in the child VM must use a file system that supports snapshots (for example, NTFS).

Live Backups for non-VSS aware VMs

Some VMs may not have the option to cascade a Shadow Copy from the host in order to render any data transactionally consistent on the VHDs for that VM.

The reasons for this may be due to the fact that the OS does not support VSS shadow copies, for example Windows XP (pre-SP2), Windows 2000 or Linux VMs.

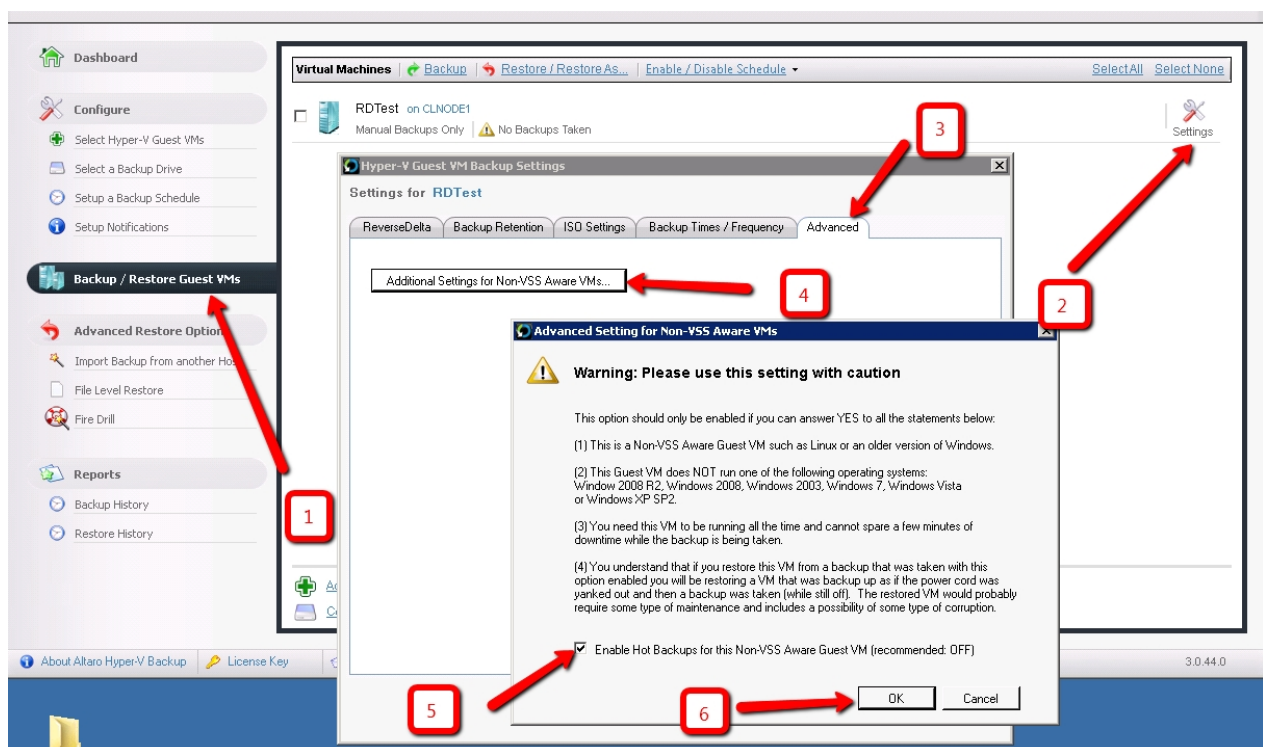

If these VMs are running at the time of a backup, the standard behavior of the Microsoft Hyper-V VSS Writer in this case is to **save** the VMs while the Shadow Copy is being taken on the host, and then restore the VMs to the running state once the Shadow Copy on the host is completed.

This ensures that the data on the VHDs for these VMs is in a consistent state during the backup.

Although this process rarely takes longer than a few seconds, this may not necessarily be the desired effect, since saving the VMs implies that the VMs will be taken offline for a specific time interval.

You may bypass this standard behavior by selecting a checkbox as follows:

- 1) Click on the “Backup/Restore Guest VMs” option in the main panel to the left of the Management Console window.
- 2) Click on the Settings icon for the VM or VMs in question.
- 3) Click on the Advanced tab in the window that appears.
- 4) Click on “Additional Settings for Non-VSS Aware VMs” button.
- 5) Select the “Enable Hot Backups” checkbox.
- 6) Click OK.

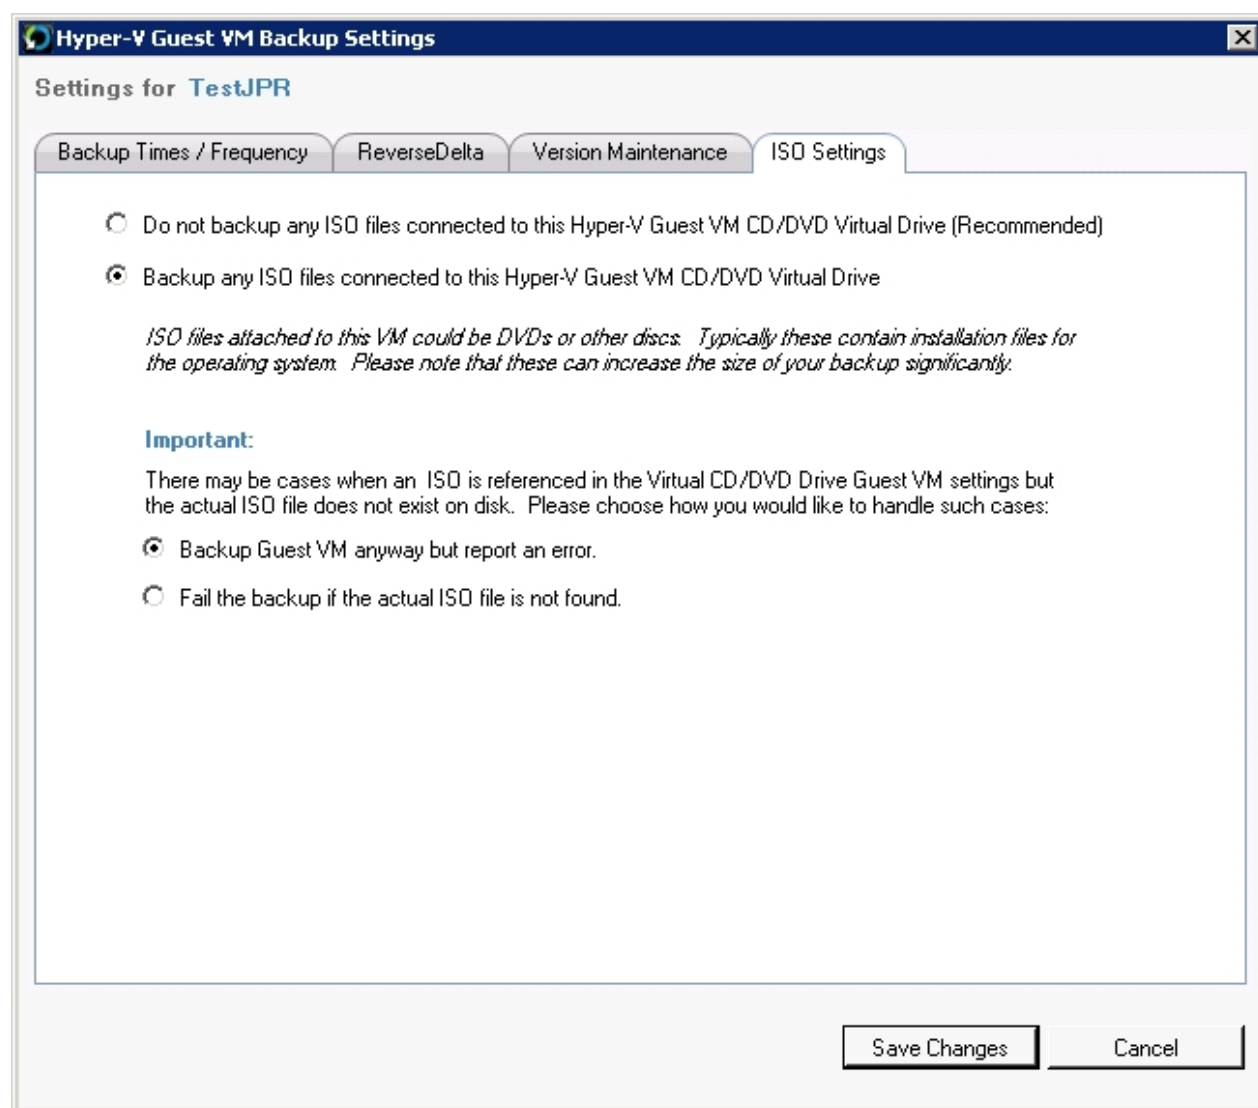

Note: Enabling this setting may lead to inconsistent data on the backup drive, so please read the warning carefully and make sure all the criteria are met before enabling this setting. It is recommended to leave this setting switched off unless you are sure of the implications of enabling this option. If in doubt, please do not hesitate to contact support@altaro.com

ISO Backups

Altaro Hyper-V Backup offers the possibility to back up any ISO files that are attached to any child VMs as CD or DVD image files. These many times are installation media, and do not need to be backed up (this is the default setting).

However, the image files could potentially contain data that should be backed up, and the "ISO Setting tab" is the one defining whether this is made, as shown in the following image:

Clicking the second radio button option will cause ISO files to be included in the backup. If a machine was backed up with this setting enabled, and is then restored, the ISO file is also restored along with the VM. In the same way, if the VM is not overwritten but a separate file is created in case the ISO file is in use by any other VM.

This setting may be enabled and disabled at will. If a previous version of a VM is restored from a backup time when this setting was enabled, then the ISO files are restored, even if the setting may have been disabled for subsequent backups.

An extra setting at the bottom of the window enables you to specify if the backups should continue or fail if any ISO files referenced in the configuration are not found. In both cases, a notification email is sent to warn about the missing file.

Restoring Hyper-V Guest VMs

There are five options when it comes to restoring a Hyper-V Guest VM:

1. **Restore Overwrite**

The Hyper-V Guest VM backup will be restored back to its original location and will retain the same name. If the original Hyper-V guest is still hosted by the Hyper-V server then it will be overwritten.

Read more [here](#).

2. **Restore as Clone**

The Hyper-V Guest VM backup will be restored to a new location and will be given a new name. The original Hyper-V guest will not be overwritten and you will end up with the cloned VM running side by side with the original VM.

Read more [here](#).

3. **Restore to a different Hyper-V Server**

A Hyper-V Guest VM backup which was taken by Hyper-V host A can be restored to Hyper-V host B. The VM will be restored to a new location on the new host and will be given a new name.

Read more [here](#).

4. **Fire Drill**

This feature allows you to perform test restores of your backed up Hyper-V Guest VMs.

Read more [here](#).

5. **File Level Restore**

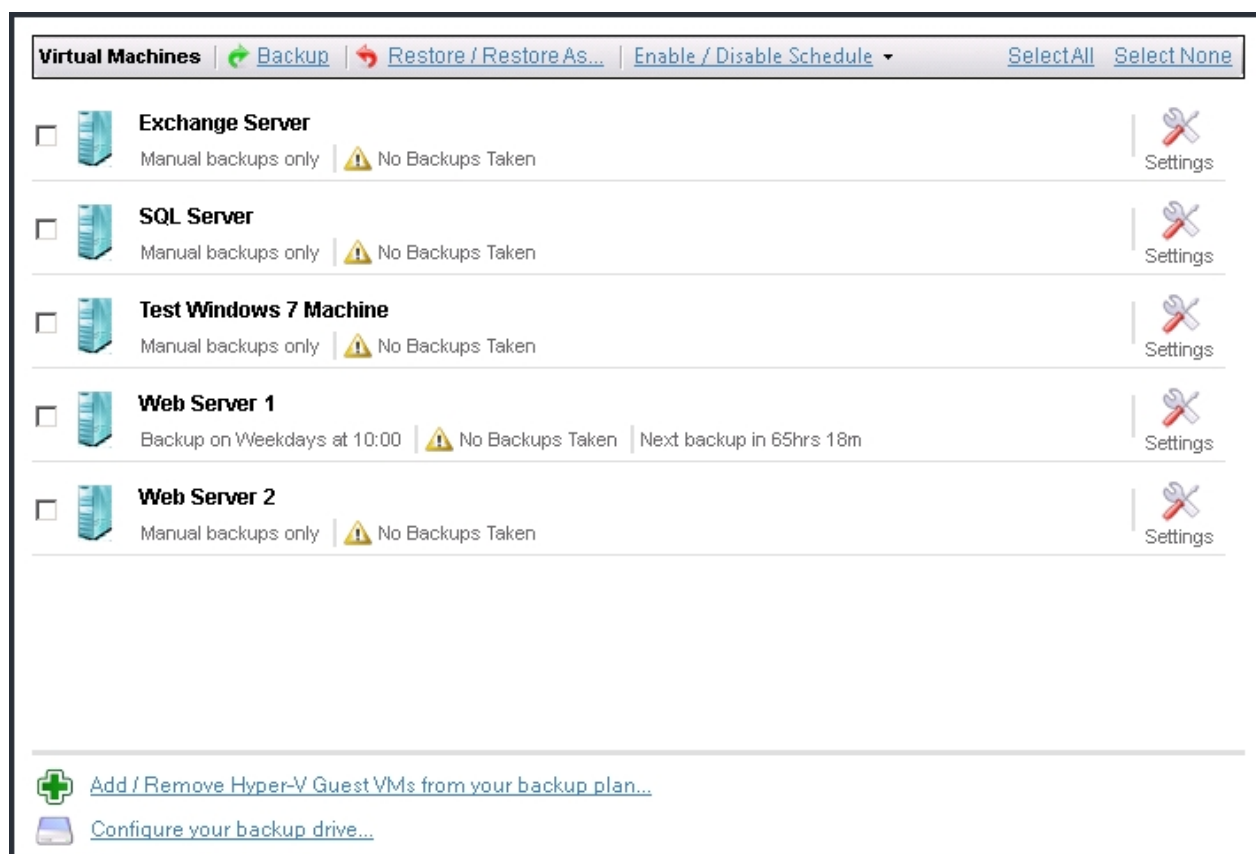

This feature allows you to restore individual files and folders from any Guest VM backup.

Read more [here](#).

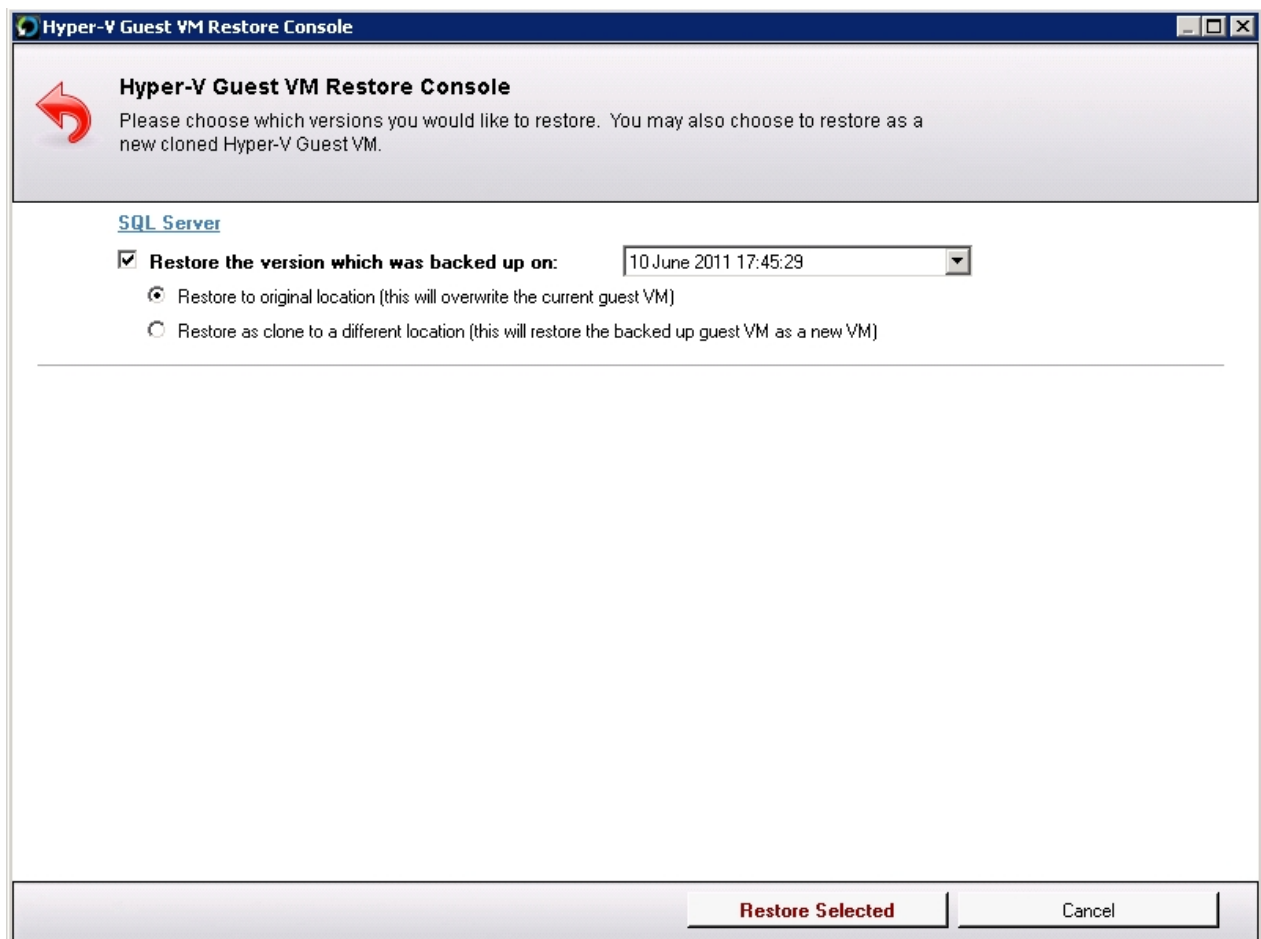

Restore Overwrite

To Restore Overwrite a VM backup first navigate to the **Backup / Restore Hyper-V Guest VM** screen as explained [here](#).

You will now be presented by this screen:

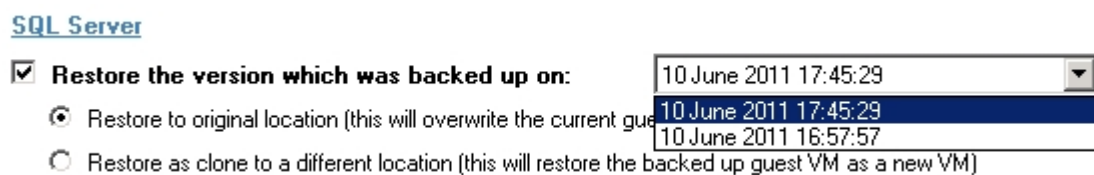

1. Select the VMs which you wish to restore now using the checkboxes to the left.
2. Click on the [Restore / Restore As] button at the top of the panel.
3. You will now be presented with the Restore Console as shown below:

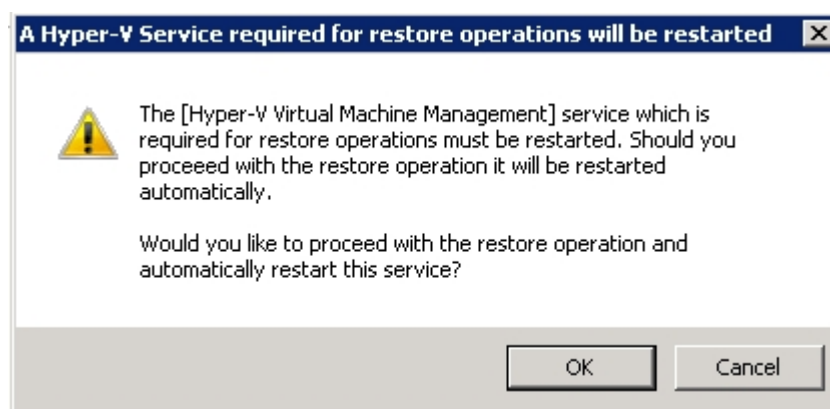

5. Ensure that the "Restore to original location" radio button is checked for each VM that you wish to restore overwrite.

4. You can use the backup time combobox to choose to restore a previous version of the VM.

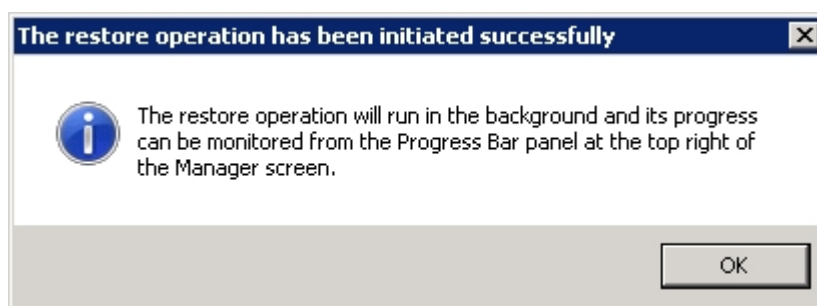

5. Click on the [Restore Selected] button to begin the restore operation.

6. You will be presented with a dialog notifying that the "Virtual Machine Management Service" will be restarted during the restore operation. This is normal and you should press OK.

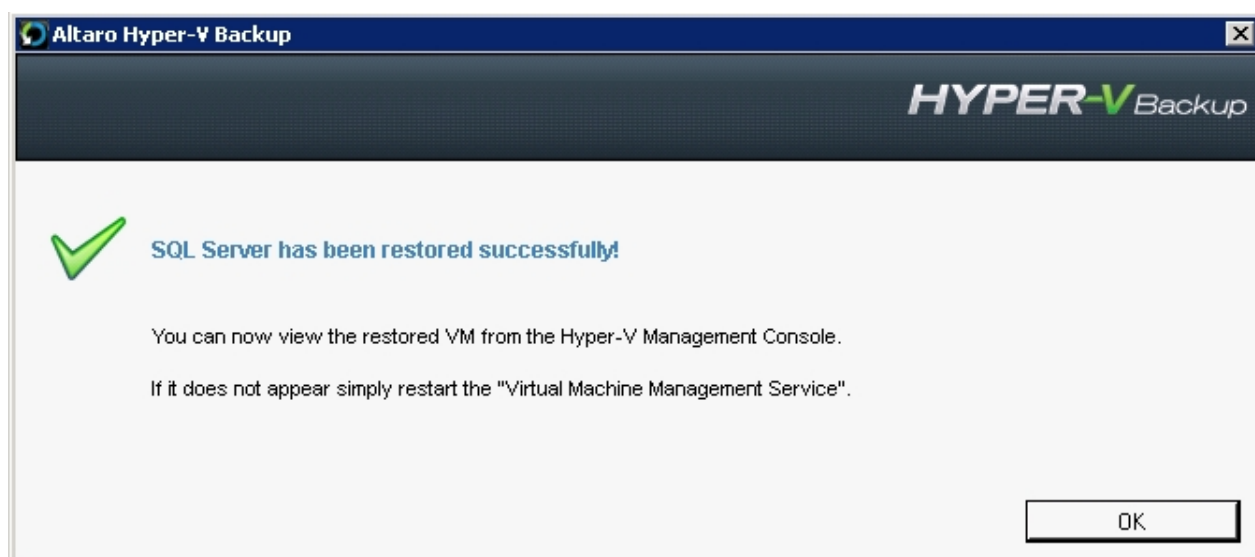

7. Once the restore begins you will notified by the following dialog.

8. You will know that a restore is taking place because the progress bar at the top right of the Management Console will be active.

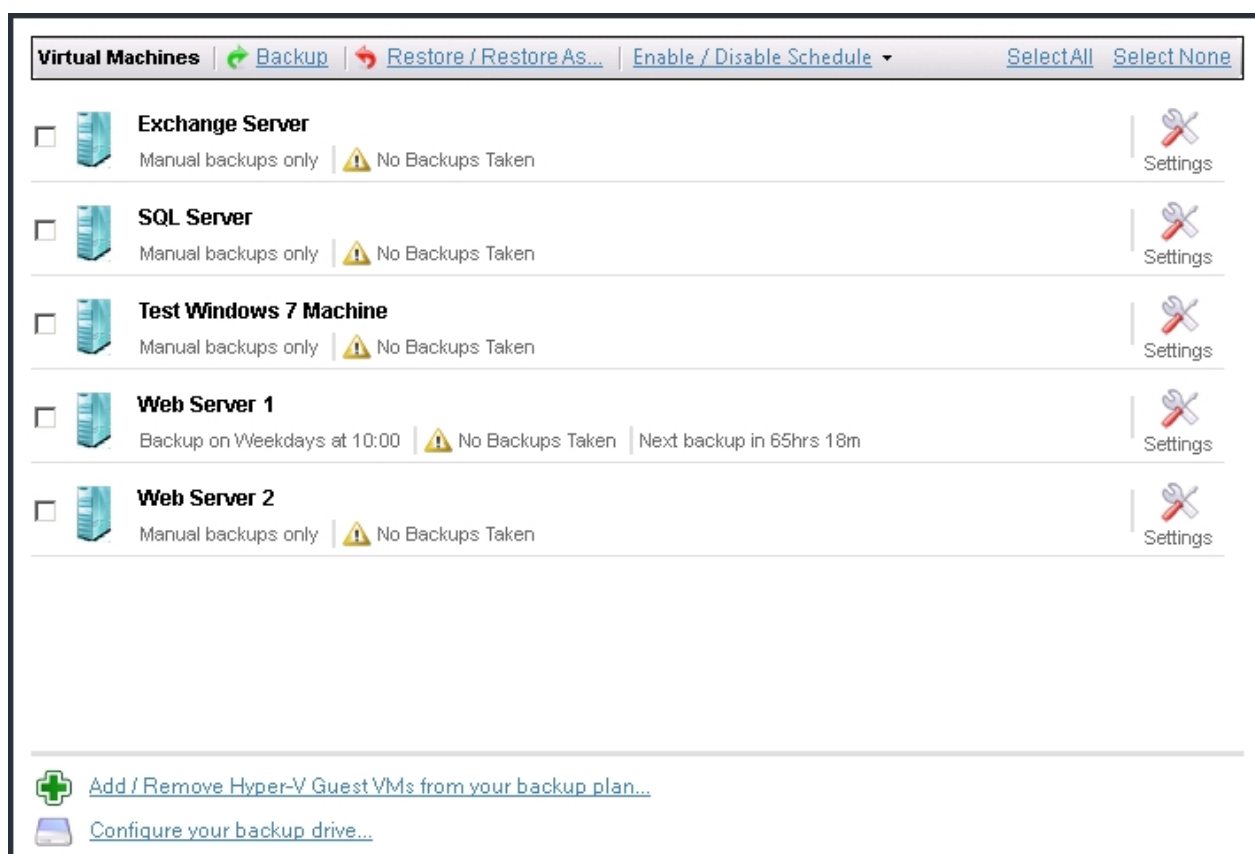

9. Finally you will be notified that the restore is completed by a popup dialog, email and event log notifications if they are [enabled](#).

Restore Clone

To Restore as Clone a VM backup first navigate to the **Backup / Restore Hyper-V Guest VM** screen as explained [here](#).

You will now be presented by this screen:

1. Select the VMs which you wish to restore as clones using the checkboxes to the left.
2. Click on the [Restore / Restore As] button at the top of the panel.
3. You will now be presented with the Restore Console as shown below:

Hyper-V Guest VM Restore Console

Please choose which versions you would like to restore. You may also choose to restore as a new cloned Hyper-V Guest VM.

SQL Server

☒ **Restore the version which was backed up on:** 10 June 2011 17:45:29

☒ Restore to original location (this will overwrite the current guest VM)

☐ Restore as clone to a different location (this will restore the backed up guest VM as a new VM)

Restore Selected **Cancel**

5. Ensure that the **"Restore as clone to a different location"** radio button is checked for each VM that you wish to restore as a clone.

SQL Server

☒ **Restore the version which was backed up on:** 10 June 2011 17:45:29

☐ Restore to original location (this will overwrite the current guest VM)

☒ Restore as clone to a different location (this will restore the backed up guest VM as a new VM)

Guest VM Name: SQL Server (10-06-2011 17h45m29 Clone)

☒ Disable network card (recommended to avoid IP conflicts)

Restore Configuration Files to: ...

Restore VHD / AVHD Files to: ...

4. You can use the backup time combobox to choose to restore a previous version of the VM. You will also be prompted to enter a new name for the Cloned VM as well as the restore location for the configuration files and the VHD, AVHD files. Both locations can be pointing to the same folder.

By default the network card of the new cloned VM will be disabled so as to prevent IP Conflicts. You can choose not to disable the network card by unchecking the checkbox "Disabled Network Card".

SQL Server

- ☒ **Restore the version which was backed up on:** 10 June 2011 17:45:29
- ☐ Restore to original location (this will overwrite the current guest VM)
- ☒ Restore as clone to a different location (this will restore the backed up guest VM as a new VM)

Guest VM Name: SQL Server (10-06-2011 17h45m29 Clone)

☒ Disable network card (recommended to avoid IP conflicts)

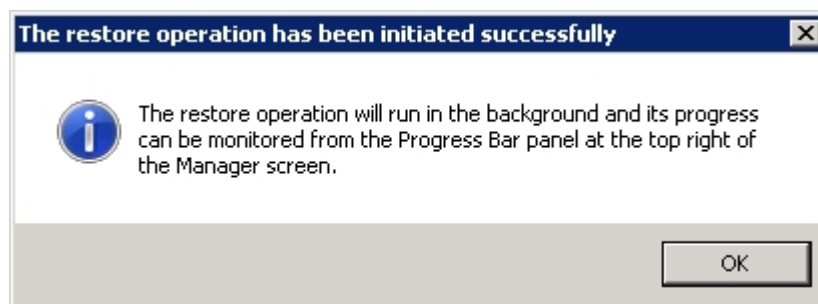

Restore Configuration Files to:

Restore VHD / AVHD Files to:

- Click on the [Restore Selected] button to begin the restore operation.
- You will be presented with a dialog notifying that the "Virtual Machine Management Service" will be restarted during the restore operation. This is normal and you should press OK.

- Once the restore begins you will be notified by the following dialog.

- You will know that a restore is taking place because the progress bar at the top right of the Management Console will be active.

9. Finally you will be notified that the restore is completed by a popup dialog, email and event log notifications if they are [enabled](#).

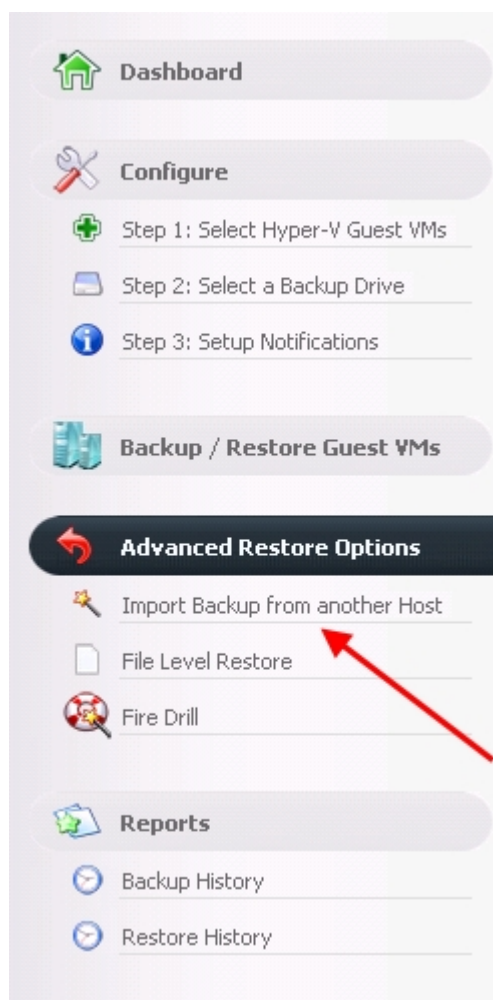

Restore to different Hyper-V server

To import a backup from another Hyper-V guest and restore it you should use the **Restore Import Wizard**.

This can be accessed as follows:

1. Open the **Management Console** as described [here](#).
2. Navigate to the "Advanced Restore Options" menu at the left hand side of the screen and click on the **[Import Backup from another Host]** sub-menu item.

Using the Restore Import Wizard:

1. When viewing the welcome screen click on [Next] You will now be presented with a screen where you can choose a backup drive which contains the backup that you wish to import.

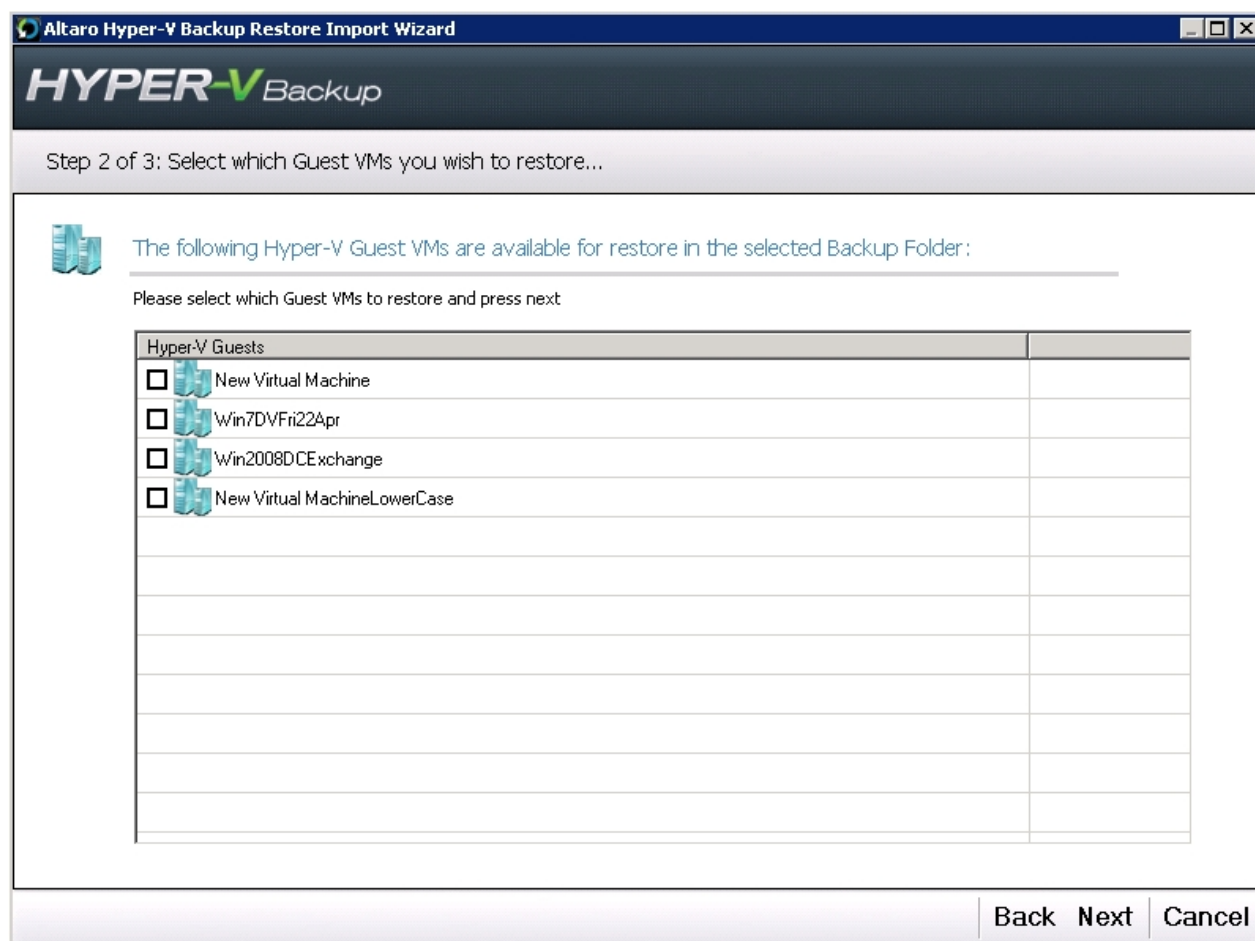

2. Select the Backup Folder containing the required backup and press [Next].

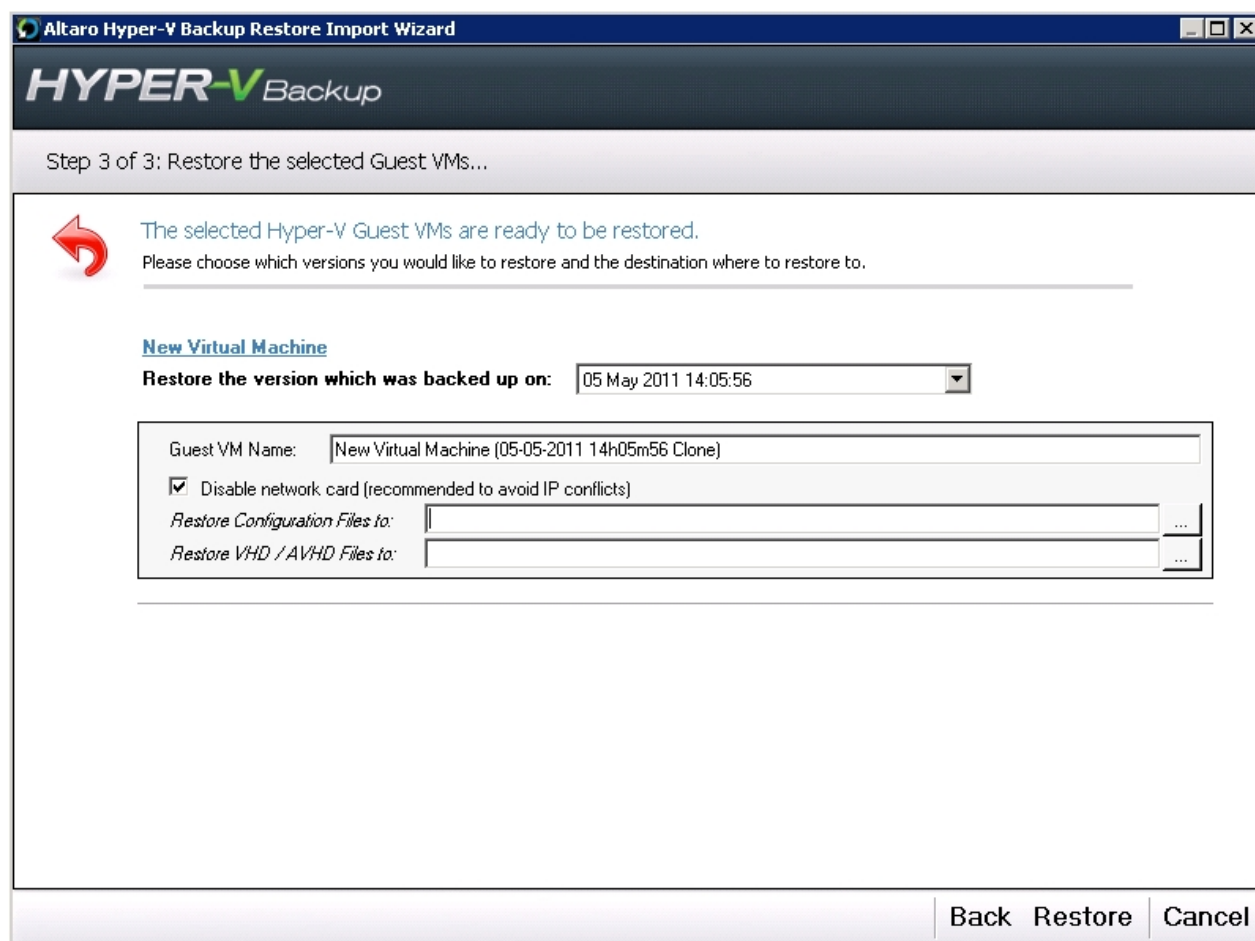

Please note that you can use the label buttons at the top of the screen to:

- Choose a UNC network path upon which the required backup is stored.
- Specify a subfolder within the backup drive or UNC Path which contains the backup folder if it is not stored in the root folder.

3. Next you will be presented with a list of VMs which have been backed up within the selected backup folder.

4. Now select the VM or VMs which you wish to restore to the current Host and press [NEXT].
5. You will now be presented with a Restore Console as shown below:

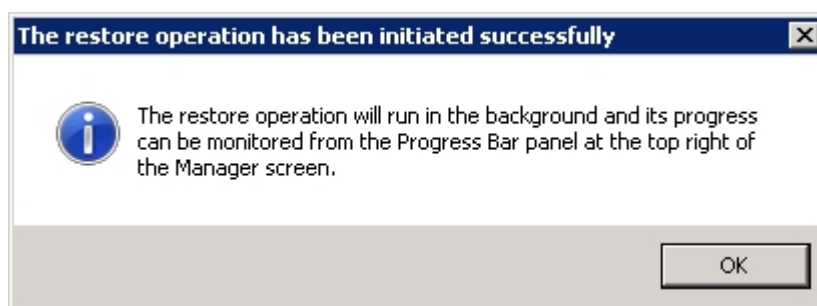

6. You can use the backup time combobox to choose to restore a previous version of the VM. You will also be prompted to enter a new name for the Cloned VM as well as the restore location for the configuration files and the VHD, AVHD files. Both locations can be pointing to the same folder.

By default the network card of the new cloned VM will be disabled so as to prevent IP Conflicts. You can choose not to disable the network card by unchecking the checkbox "Disabled Network Card".

6. Click on the [Restore] button to begin the restore operation.
7. You will be presented with a dialog notifying that the "Virtual Machine Management Service" will be restarted during the restore operation. This is normal and you should press OK.

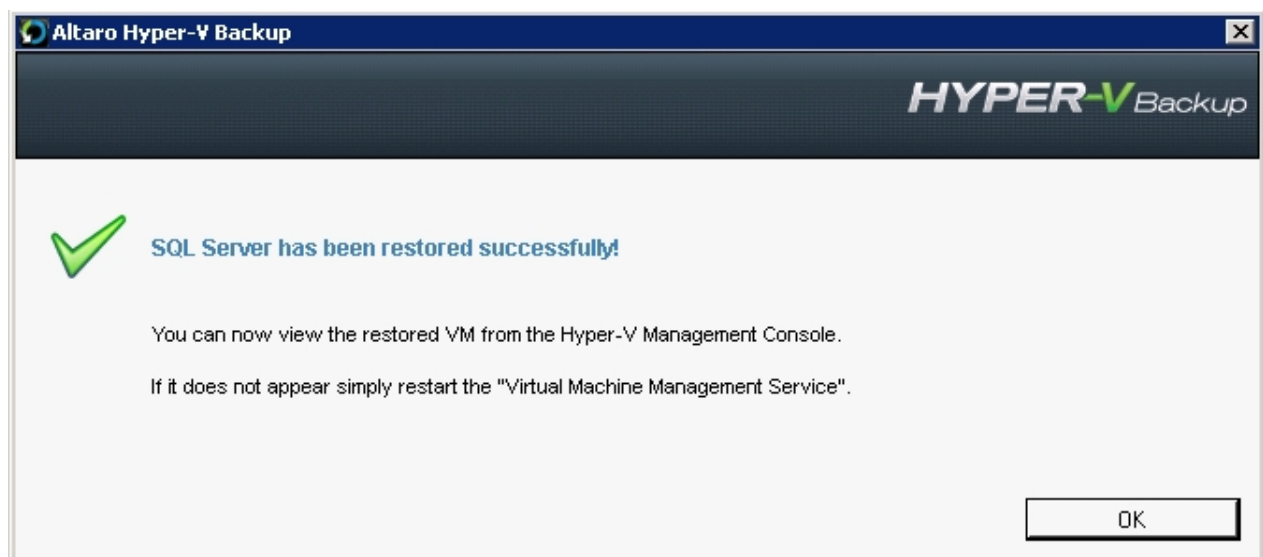

7. Once the restore begins you will notified by the following dialog.

8. You will know that a restore is taking place because the progress bar at the top right of the Management Console will be active.

9. Finally you will be notified that the restore is completed by a popup dialog, email and event log notifications if they are [enabled](#).

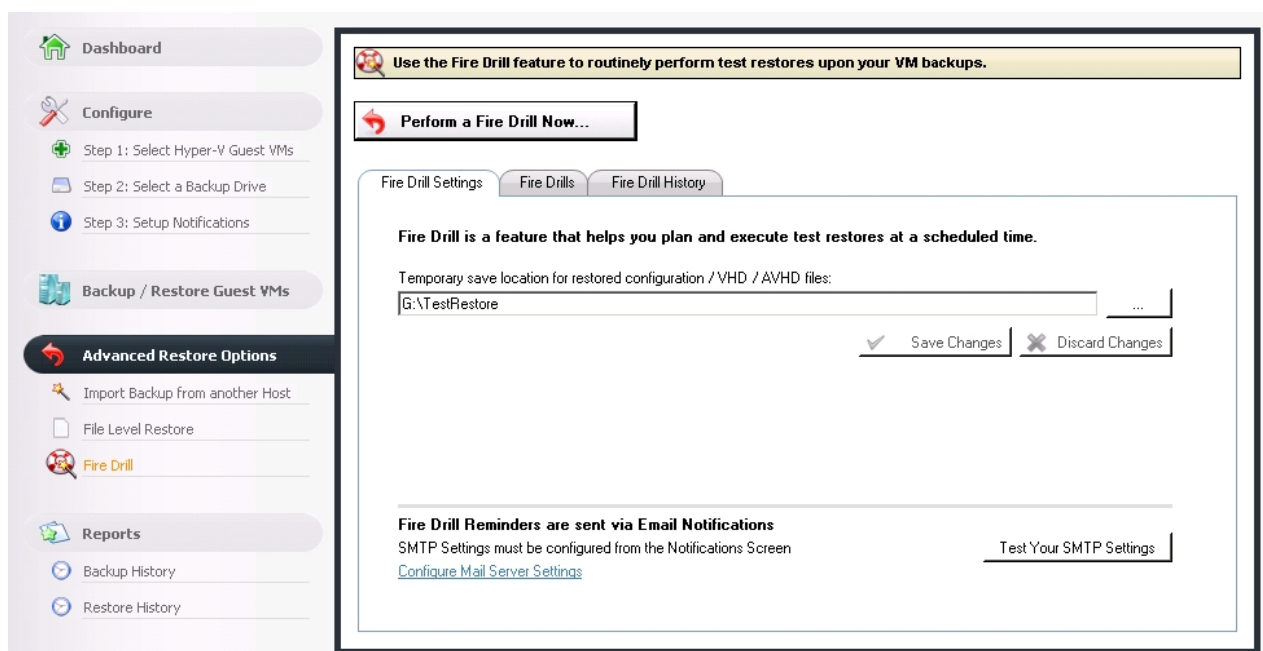

Fire Drill

The Fire Drill feature allows you to plan and execute test restores at a scheduled time. That way you can easily verify that your VMs are being backed up correctly.

Before starting a Fire Drill Restore please ensure that at least one successful backup has been taken for the VM in question.

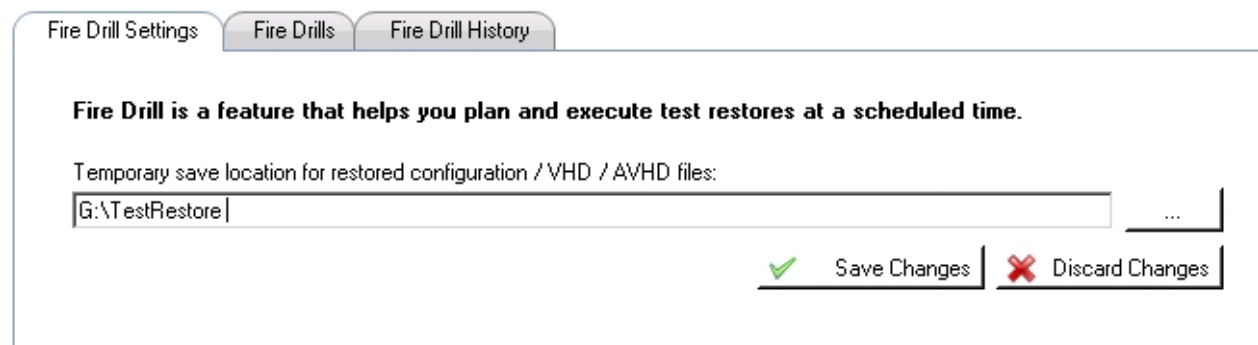

To begin open the **Management Console** as described [here](#) and select the Fire Drill Screen from the left hand side menu.

Configuring Fire Drill Settings

Before performing a Fire Drill you must first specify a default location where to store temporary restored files.

This location must have enough free space to hold any VMs which are temporarily restored to it.

The screenshot shows the 'Fire Drill Settings' tab. It contains a description: 'Fire Drill is a feature that helps you plan and execute test restores at a scheduled time.' Below this is a label 'Temporary save location for restored configuration / VHD / AVHD files:' followed by a text input field containing 'G:\TestRestore' and a browse button '...'. At the bottom right are two buttons: 'Save Changes' with a green checkmark icon and 'Discard Changes' with a red X icon.

Should you wish to receive Fire Drill reminders and notifications then it is important to configure your SMTP Settings as explained [here](#). Fire drill email notifications are sent for the following events:

- An automatic Fire Drill will begin in 1 hour.
- A reminder for a Fire Drill has been scheduled.
- A Fire Drill restore has completed.

Fire Drill Reminders are sent via Email Notifications

SMTP Settings must be configured from the Notifications Screen

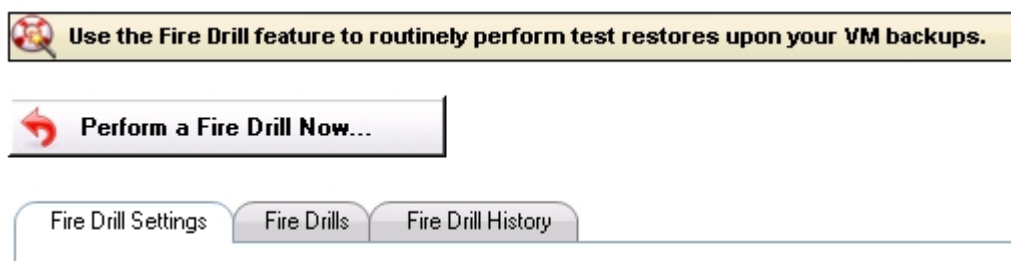

[Configure Mail Server Settings](#)

[Test Your SMTP Settings](#)

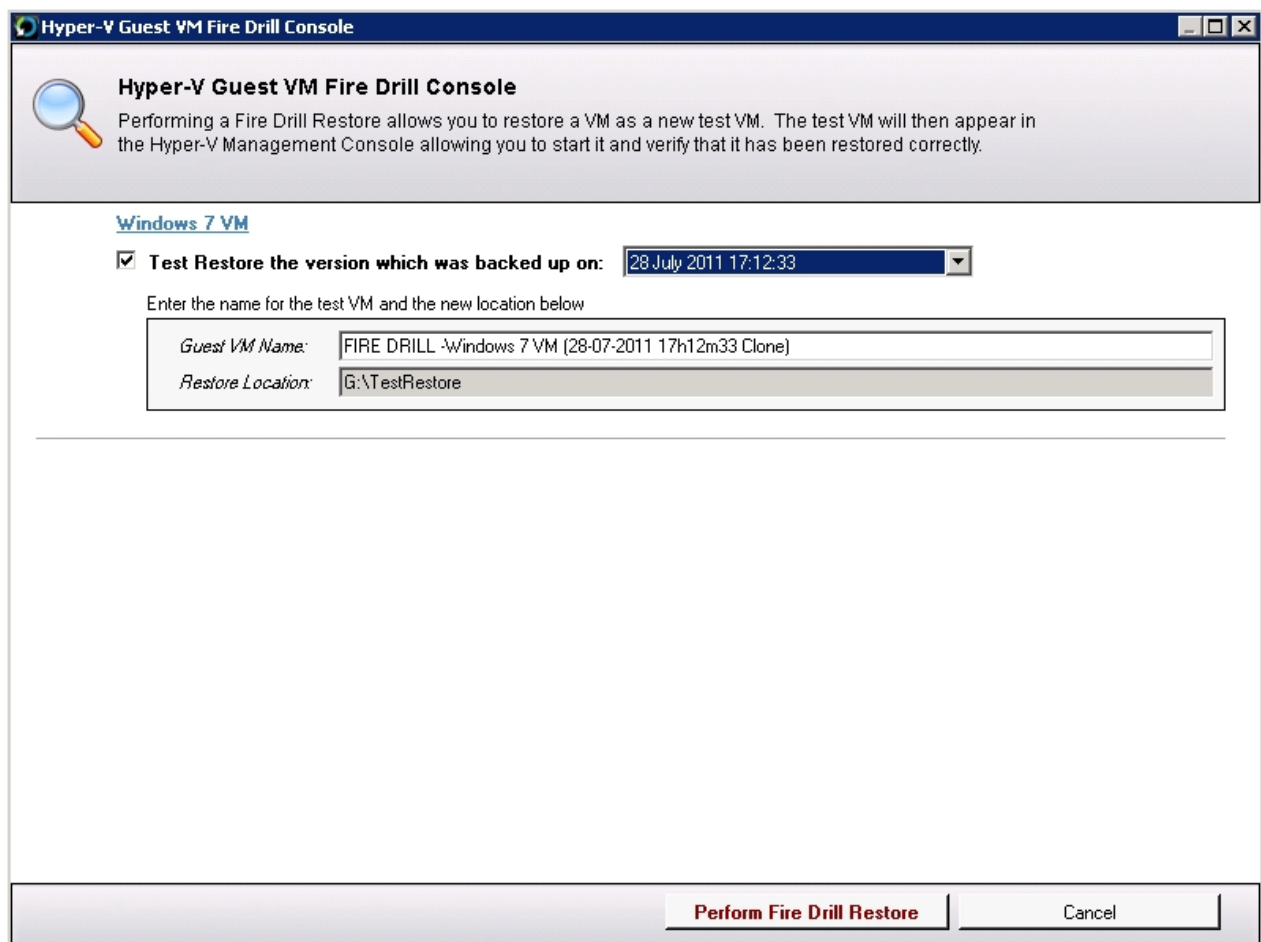

Performing a manual Fire Drill

By performing a manual Fire Drill you will perform a test restore on one or more VMs. These VMs will be restored as clones to a new location and will be attached to Hyper-V. The names of the test VMs will contain the text "Fire Drill" and a timestamp of the backup version restored.

1. To perform a manual Fire Drill simply click on the button "**Perform a Fire Drill Now**".

2. Select which VM backups and which backup versions you would like to include in the Fire Drill.

3. Click on "**Perform Fire Drill Restore**".

4. Confirm that you would like to proceed and you will see that the Fire Drill restore has begun from the top right progress bar.

5. Once the restore has completed then you will be notified on whether it was successful or not. If it was successful you will find that the new test VM has been attached to Hyper-V and can be used to verify that it

has been restored correctly.

Please note that to avoid conflicts the Network Card is disabled for VMs which are restored using Fire Drill.

Configuring automatic scheduled Fire Drill Restores / Reminders

A great feature of Fire Drill is that users are able to schedule routine Fire Drill Restore operations or reminders.

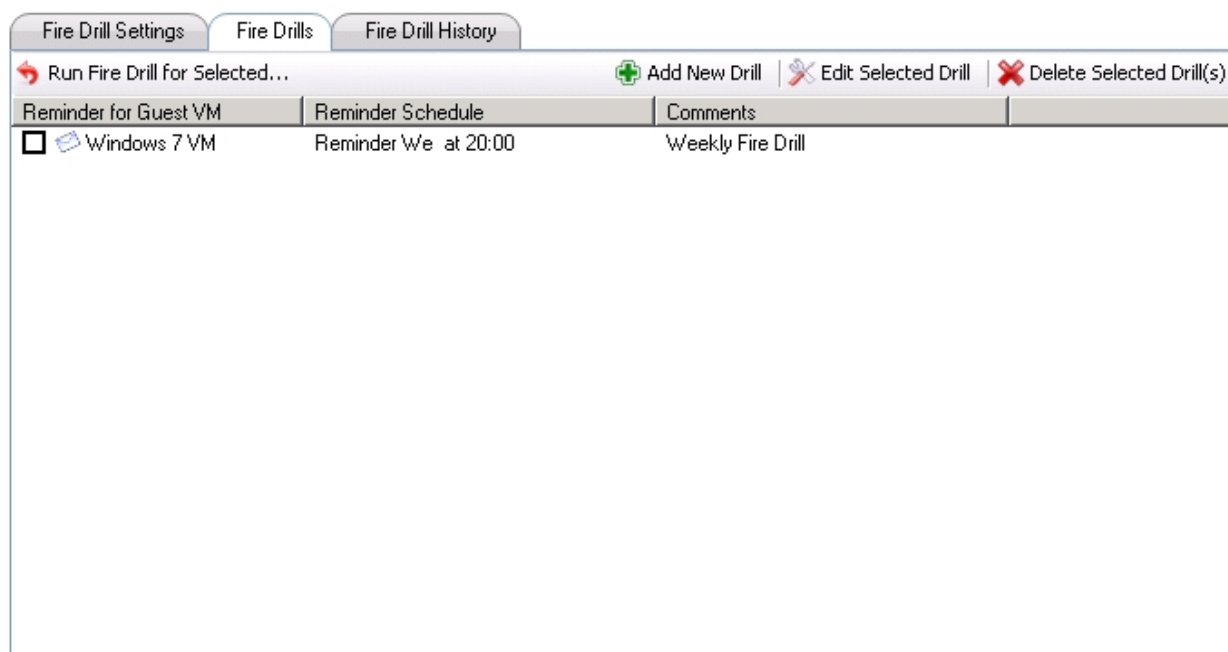

Scheduled Fire Drill Restore Operation

At the scheduled time the VM in question will be restored as a clone and attached to Hyper-V. One hour before the fire drill restore begins, users will receive an email notification followed by a second email once the restore is completed. *(Emails will only be received if the Mail Notifications are configured correctly.)*

Scheduled Fire Drill Email Reminders

In this case at the scheduled time - instead of restoring the VM - a simple email reminder will be sent to remind the user to perform a Fire Drill restore. *(Emails will only be received if the Mail Notifications are configured correctly.)*

To configure schedule restores / reminders you must use the "Fire Drills" Tab.

1. To add a new Fire Drill schedule simply click on the "Add New Drill" toolbar button. Any you will be presented with the following dialog.

2. Select a VM upon which you wish to schedule a Fire Drill restore or Reminder. This can be done by clicking on "Choose a Guest VM".

3. Add a number of date / time rows to the Fire Drill Schedule panel. You can choose a combination of schedules such as "Mondays at 6pm and Saturdays at 10am and 10pm".

4. Choose whether you would like a Fire Drill restore to begin automatically. This can be done by checking or unchecking the **"Perform Test Restore on Schedule"**. If you leave this option unchecked then you will simply receive an email reminder. Please note that to avoid conflicts the Network Card is disabled for VMs which are restored using Fire Drill.

5. You may also add some comments to document the Fire Drill schedule.

6. Finally click "Save Changes" and your new Fire Drill schedule will be enabled.

If you wish to edit or delete existing Fire Drill schedules simply use the toolbar buttons at the top of the tab.

Fire Drill History / Deleting Temporary Restored VMs

Finally the "Fire Drill History" tab will provide users with a history of any Fire Drill restores which have been performed.

Fire Drill Time	Restored VM	VM Status
<input type="checkbox"/> 7/28/2011 5:01:45 PM	FIRE DRILL -New Virtual Machine44 (13-07-2011 01h00...	VM has been deleted from Hyper-V
<input type="checkbox"/> 7/28/2011 7:15:09 PM	FIRE DRILL -New Virtual Machine44 (12-07-2011 13h13...	VM has been deleted from Hyper-V
<input type="checkbox"/> 7/29/2011 11:07:09 AM	FIRE DRILL -New Virtual Machine44 (13-07-2011 01h00...	VM has been deleted from Hyper-V

Each time a Fire Drill is performed an entry is made in the Fire Drill History list. A status column also indicates whether the restored VM is still attached to Hyper-V.

Should you wish to delete any temporarily restored VMs simply select them from the list and click on "Delete Selected Fire Drill VM(s)". At this point they will be detached from Hyper-V and deleted from the temporary restore location.

Once deleted the entry will still appear in the History list, but the status column will indicate that the VM has been deleted from Hyper-V.

File Level Restore

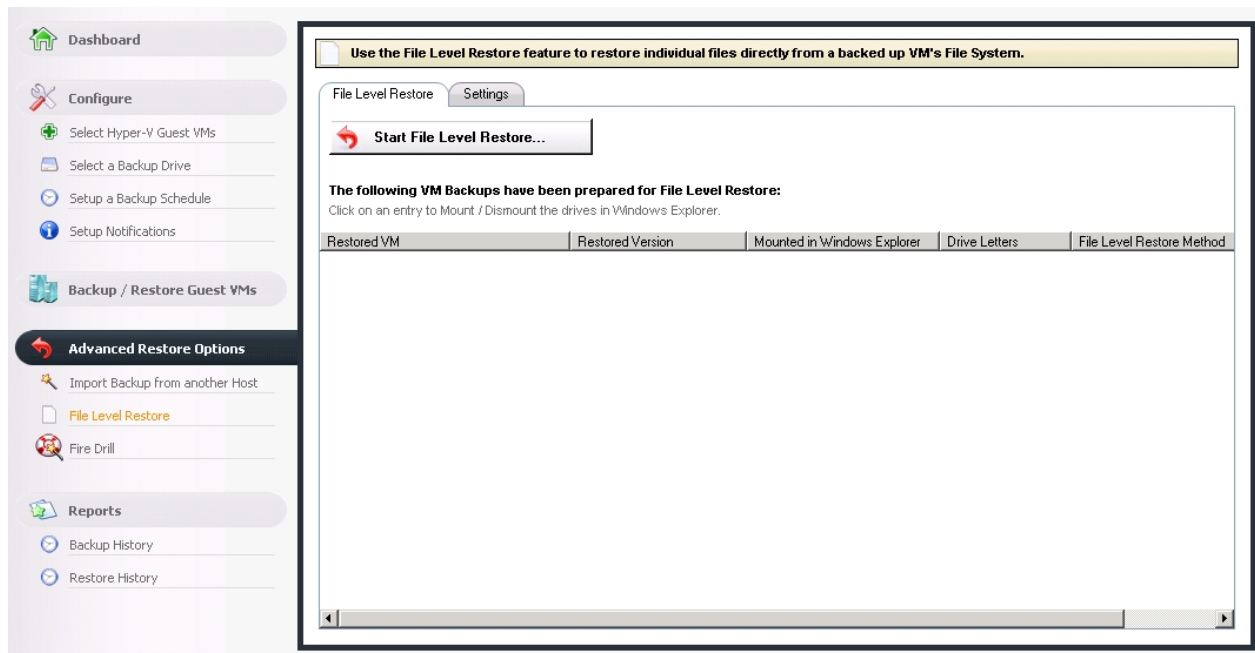

The File Level Restore feature allows you to explore the contents of the VHD / AVHD files of a VM backup. That way you can easily restore specific files and folders from a VM backup without having to restore and attach the entire VM.

Please note that:

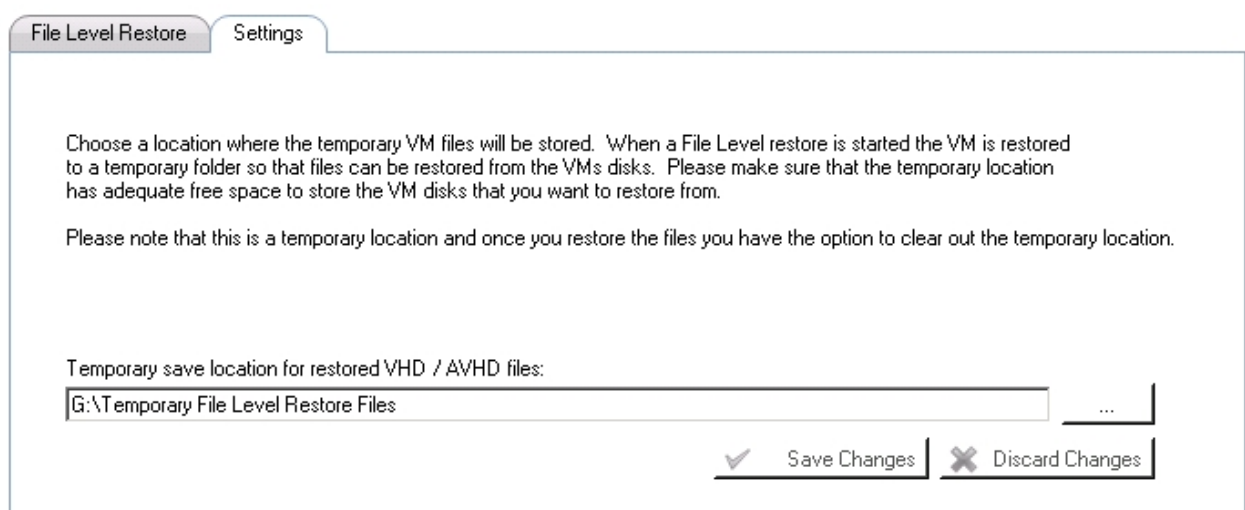

- if you wish to perform a File Level Restore for a VM which contains AVHD snapshots then you will need to follow an [alternative procedure](#).
- if you wish to perform a File Level Restore an older backup version of a VM then you will need to follow an [alternative procedure](#).

Before starting a File Level Restore please ensure that at least one successful backup has been taken for the VM in question.

1. Open the **Management Console** as described [here](#) and select the File Level Restore Screen from the left hand side menu.

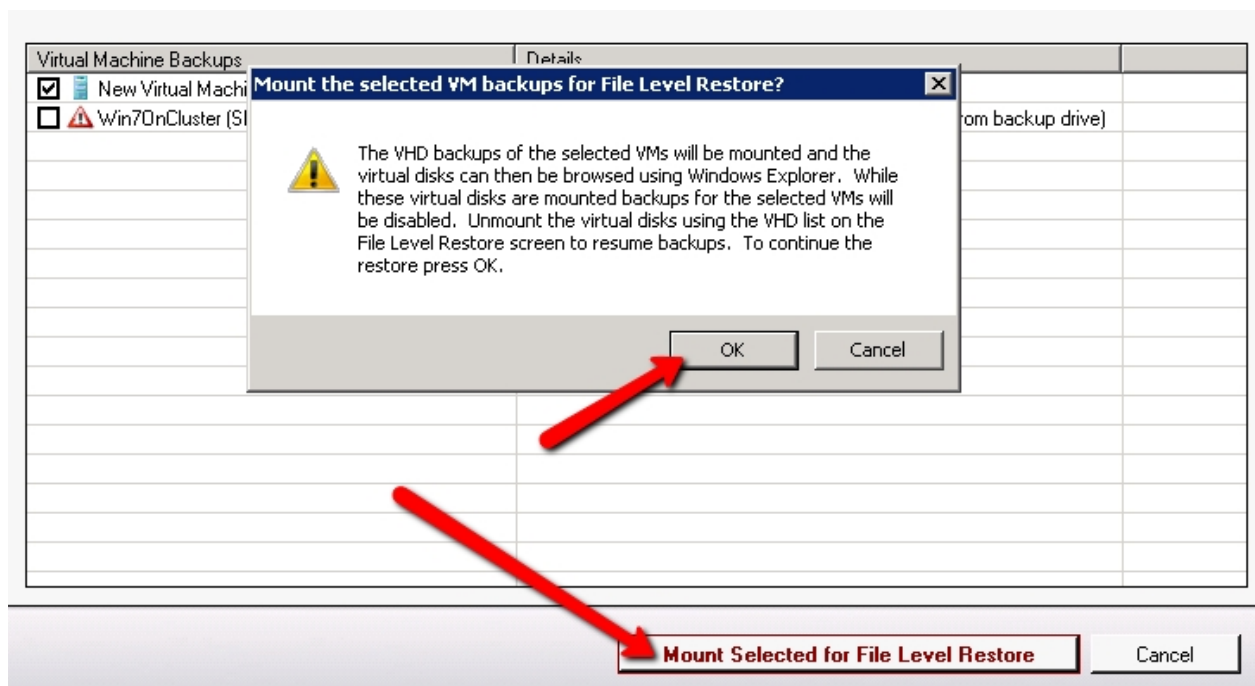

2. If this is the first time that you are using this feature then you must setup the temporary restore location by using the **settings** tab. The temporary restore location will contain any temporarily restored VHD / AVHD files. These can then be deleted automatically once you are done from the File Level Restore.

3. Once the temporary folder has been chosen you can simply click on "Start File Level Restore..." to begin. You will then be presented with a list of VM Backups available for File Level Restore.

- if you wish to perform a File Level Restore for a VM which contains AVHD snapshots then you will need to follow an [alternative procedure](#).
- if you wish to perform a File Level Restore an older backup version of a VM then you will need to follow an [alternative procedure](#).

- 97 / 144

5. Once you confirm the above step you will see a progress bar for a few seconds and assuming that all is successful the relevant Virtual Disks (VHDs) will be mounted and a Windows Explorer window will appear for each drive letter.

It is possible that a drive letter is not automatically assigned by Windows when the disks are mounted. If this happens then you must use the **Disk Management** utility in the Windows **Server Manager** console to assign drive letters. Once you do you can then manually browse the mounted disks using **My Computer**.

6. Finally you will see that the VHD disks belonging to the VMs selected above are now listed in the File Level Restore screen. Right-clicking on a VHD / AVHD entry in the list will bring up a context menu with the following options:

- Unmount
- Browse using Windows Explorer

Unmounting a Virtual Disk which was mounted directly from the backup drive will automatically remove the entry from the list and delete any temporary files.

Important Points:

- Backups will be disabled for any VM which currently has one of more VHDs mounted. To resume backups for this VM then simply unmount the VHDs from the File Level Restore screen.

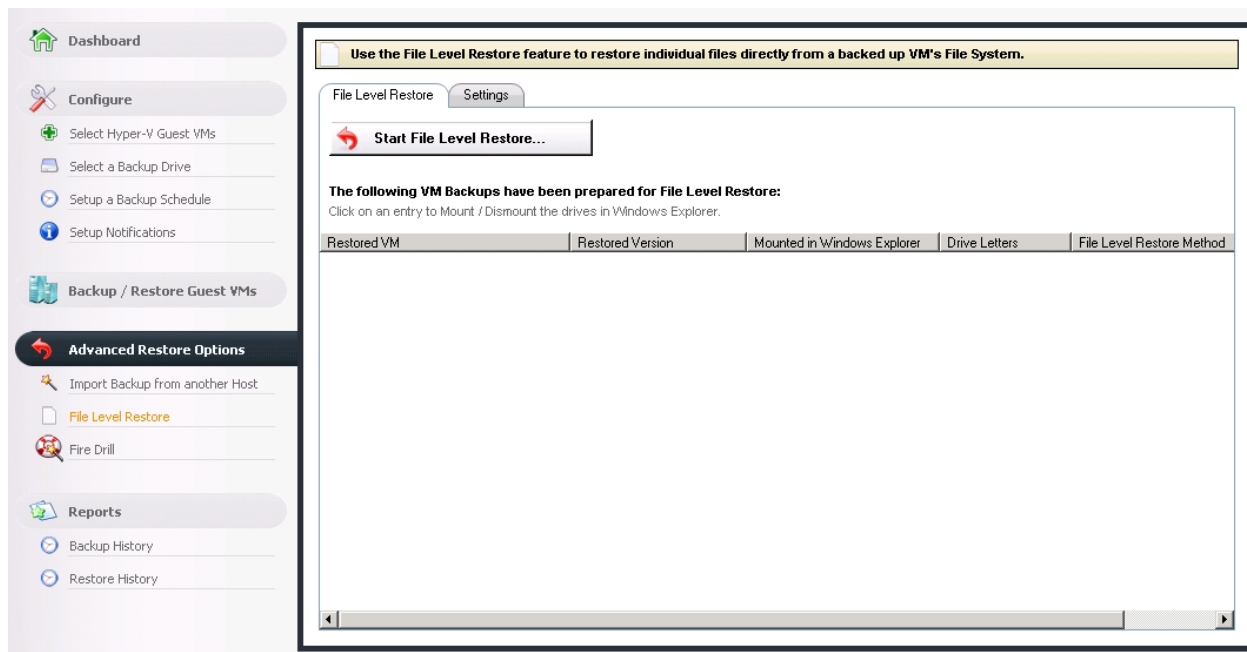

File Level Restore for AVHD Files / Older Backup Versions

When performing File Level Restore for a VM which contains snapshots (AVHDs) or from a older delta backup then the virtual disks first need to be restored to a local temporary folder. They are then mounted from this temporary folder instead of being mounted directly from the backup drive. Therefore there are a few extra / different steps required as listed below.

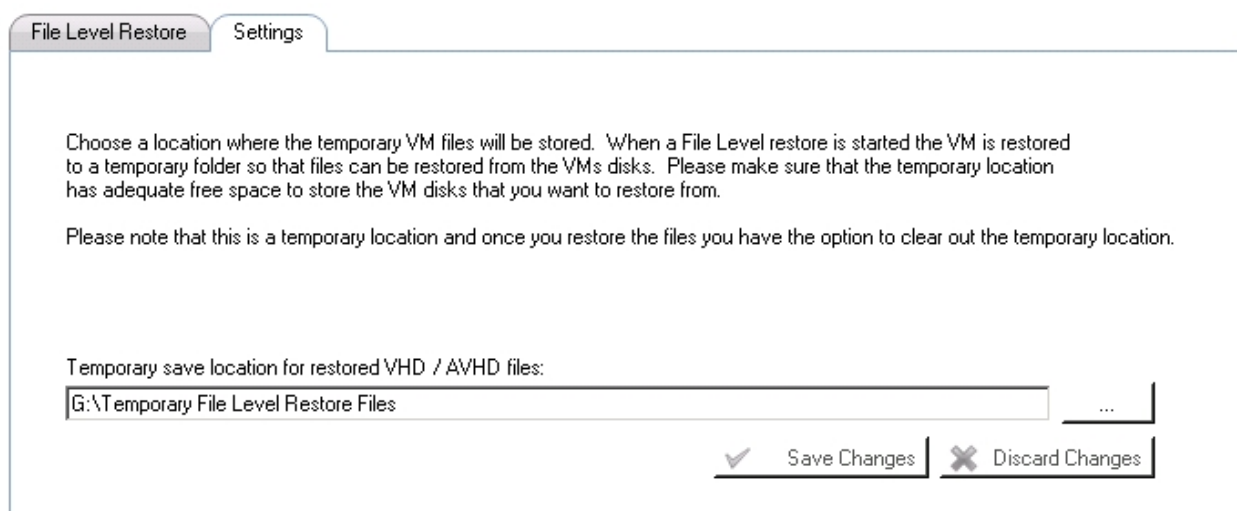

Please Note: If you simply want to perform a File Level Restore from the latest backup of a VM (VHD files only) then follow [this procedure](#). Virtual Disks do not need to be restored first and are mounted instantly.

Before starting a File Level Restore please ensure that at least one successful backup has been taken for the VM in question.

1. Open the **Management Console** as described [here](#) and select the File Level Restore Screen from the left hand side menu.

2. If this is the first time that you are using this feature then you must setup the temporary restore location by using the **settings** tab. The temporary restore location will contain any temporarily restored VHD / AVHD files. These can then be deleted automatically once you are done from the File Level Restore.

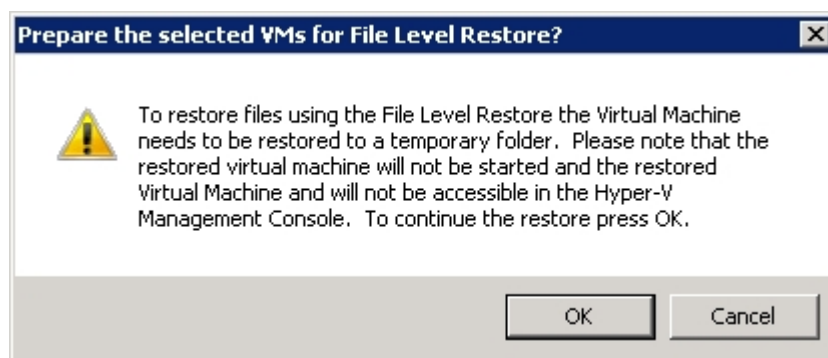

3. Once the temporary folder has been chosen you can simply click on "Start File Level Restore..." to begin. You will then be presented with a list of VM Backups available for File Level Restore. Since we are not restoring the latest backup in the case we need to click of one of the following options: (highlighted in the screenshot below)

-

Simply select and click on "Prepare Selected for File Level Restore".

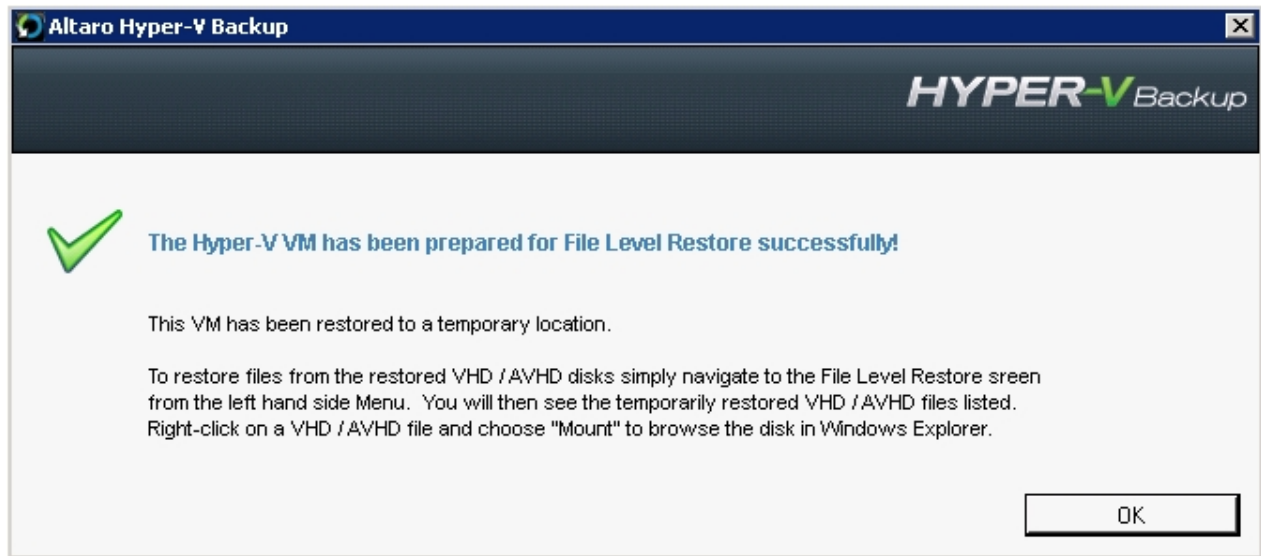

5. You will be prompted to confirm your selection. Simply click OK.

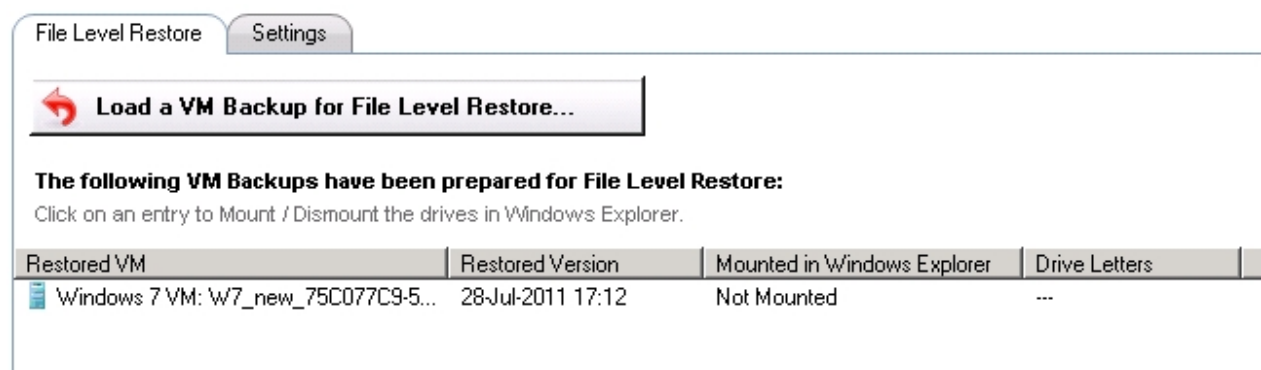

6. You will now notice that the progress bar at the top of the Management Console has been updated to show the progress of the restore operation. This simply indicates the progress of copying all required virtual disks to the the temporary restore folder.

7. Once the temporary files are restored you will be presented with the following dialog.

8. The next step is to view the File Level Restore screen once again. One or more VHD / AVHD files should now be listed in the list of virtual disks available for File Level Restore.

7. Selecting Mount will attach VHD / AVHD disk and assign a drive letter to each of its partitions. The partitions will then be opened automatically in Windows Explorer allowing you to browse their contents and copy any files that you wish to restore. The partitions are mounted in Read Only mode.

If for some reason the disks are mounted but no drive letters are assigned - then it simply means that the drives were not yet ready. Unmount them and try and mount them again.

Restored VM	Restored Version	Mounted in Windows Explorer	Drive Letters
Windows 7 VM: W7_new_75C077C9-5...	28-Jul-2011 17:12	Mounted	J:

The VHD file has been mounted successfully

You may now choose to browse the mounted partitions in Windows Explorer.

OK

Delete temporary VHD file and remove from list

11. Finally you may optionally choose to delete the temporarily restored VHD / AVHD files and remove them from the list. This can simply be achieved by choosing "**Delete temporary VHD / AVHD Files and Remove from list**" from the context menu. If this option does not appear then you should unmount the disks first.

You will be presented with the following dialog - simply click OK and the temporary files will be deleted for you.

Microsoft VSS (Shadow Copy)

The Microsoft Volume Shadow Service (VSS) is Microsoft technology that forms part of Windows Server 2008 R2. This component allows applications to access a "point in time" snapshot of a logical drive on the host machine, including any VHD and related virtual machine files on that drive. This enables these files to be accessed even if they are in use or locked. It also ensures that the VHD and related files are in a consistent state and all data has been flushed to disk before they are accessed for backup purposes.

Altaro Hyper-V Backup comes with its own VSS Requester and communicates with the Microsoft Volume Shadow Copy Service in order to trigger off and release shadow copies on the host machine.

Important facts and FAQs:

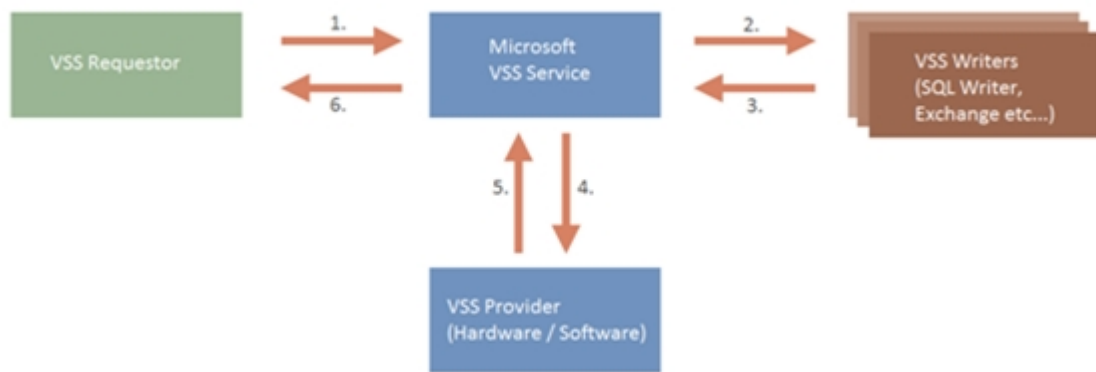

The Volume Shadow Copy service is a part of the Windows operating system and any malfunctions in this component are outside of the control of Altaro Hyper-V Backup, which acts only as a shadow copy "requester" and does not possess any shadow copy functionality per se.

Shadow copies are done on a Volume basis, and cannot be done on a particular folder set only.

A shadow copy operation does not result in all the data on a volume being copied over to a shadow copy, but rather a point in time is set and any changes (writes) to the volume contents from that point on are kept in a "changes" area. In that way a shadow copy can be completed in a matter of seconds.

The shadow copy requested by Altaro Hyper-V backup is non-persistent and is disposed after a particular backup operation completes.

The overall process may be visualized in the following diagram, which is a considerably simplified version of what actually happens, but offers a good birds-eye view:

Altaro Hyper-V Backup first requests a list of VSS writers from the VSS service and then requests that all the writers affected start preparing for the shadow copy by making their data consistent on the disk. Once this is done, the VSS communicates with the VSS provider which actually executes the point in time snapshot. The VSS service then informs Altaro Hyper-V Backup about the details of the newly created shadow copy.

After the backup completes, Altaro Hyper-V Backup instructs the VSS service to release the shadow copy.

MS Hyper-V VSS Writer

One of the writers on a 2008 R2 system is called the Hyper-V VSS Writer, and this writer manages the shadow Copy of all files related to the virtual machines running on the host machine, such as the VHD files. When Altaro Hyper-V Backup triggers off a shadow copy (just before a backup starts), it integrates with the Hyper-V VSS writer and passes on information to this writer about which virtual machines are about to be backed up.

In turn, Hyper-V uses one of two mechanisms to prepare each VM for backup. The default backup mechanism is called the "Saved State" method, where the VM is put into a saved state during the processing of the shadow copy, snapshots are taken of the appropriate volumes, and the VM is returned to the previous state after the shadow copy.

The other backup mechanism is called the "Child VM Snapshot" method, which will be discussed [here](#).

ReverseDelta

RD Version 2 is now available with Altaro Hyper-V Backup version 3.0

Definition of Reverse Delta

Reverse Delta Version 2 offers two advantages:

1. It is a space-saving technology developed by Altaro Software that enables Altaro Hyper-V Backup to keep only the changes between each version of a changed VHD (or VHDX) file and another, rather than storing the version of a file as a whole file every time it is changed.

This means that keeping multiple backup versions will require less space on your backup drive. In other terms, chunks of a VHD file that are unchanged from one version of that file to the next are only stored once on the backup disk. This is called data deduplication.

2. It also enables Altaro Hyper-V Backup to transfer only the changed blocks in a VHD file when there is already a full backup available on the backup location, making incremental backups much faster than the first backup. Notwithstanding this, the latest version of a VHD file is always stored as a full file on the backup location.

What distinguishes Reverse Delta from other deduplication technologies?

The main concern about delta files is usually that in the event of heavy data loss, the version of a file you are most likely to need is the latest one. Many users are apprehensive if this version may need to be rebuilt from an older version and one or more delta files. With Reverse Delta, the latest version of a file is always made available in its entirety and not as a delta file.

This means that if you require the latest version of a file, it is possible to access it directly from your backup drive without having to rebuild the file from delta files. The delta files are only used if you want to build a previous version of the file, building one delta file at a time for each version as you travel back in time in the reverse direction.

Periodically keeping full versions of the files

In the Advanced Settings window in Altaro Hyper-V Backup, there is an option to keep a full copy of a file every X versions as shown in the screenshot below:

Let's say we have a large file, say a 100GB VHD file, which is constantly changing and needs to be backed up every hour. The first backup is for example at 9:00am. When you back up that file the first time, it is simply copied over to the destination.

At 10:00am, it is copied over again, and at 11:00pm again and so on.

Without Reverse Delta, at this point we have 3 full versions on the backup drive: 9:00am, 10:00am, and 11:00am. That would mean 300GB are required on the backup drive in three hours, which is rather excessive.

Altaro Hyper-V Backup however creates delta files of the older files (9:00am and 10:00am) so that our latest file (11:00am) is available as a full file. The delta file is usually much smaller than the full file, and will typically be less than 10% of the size original file.

Number of delta files to keep by example:

If we choose "keep full file every 30 versions", this means that every 30 backups, the delta file is not taken, so that you never have more than 30 delta files to rebuild if you need to restore a file.

Let's say you set this setting to "5". The picture would look like this:

Full file 10:00pm (Latest, 100GB)

delta 9:00pm

delta 8:00pm

delta 7:00pm

delta 6:00pm

Full file 5:00pm (100GB)

delta 4:00pm

delta 3:00pm

delta 2:00pm

delta 1:00pm

Full file 12:00pm (100GB)

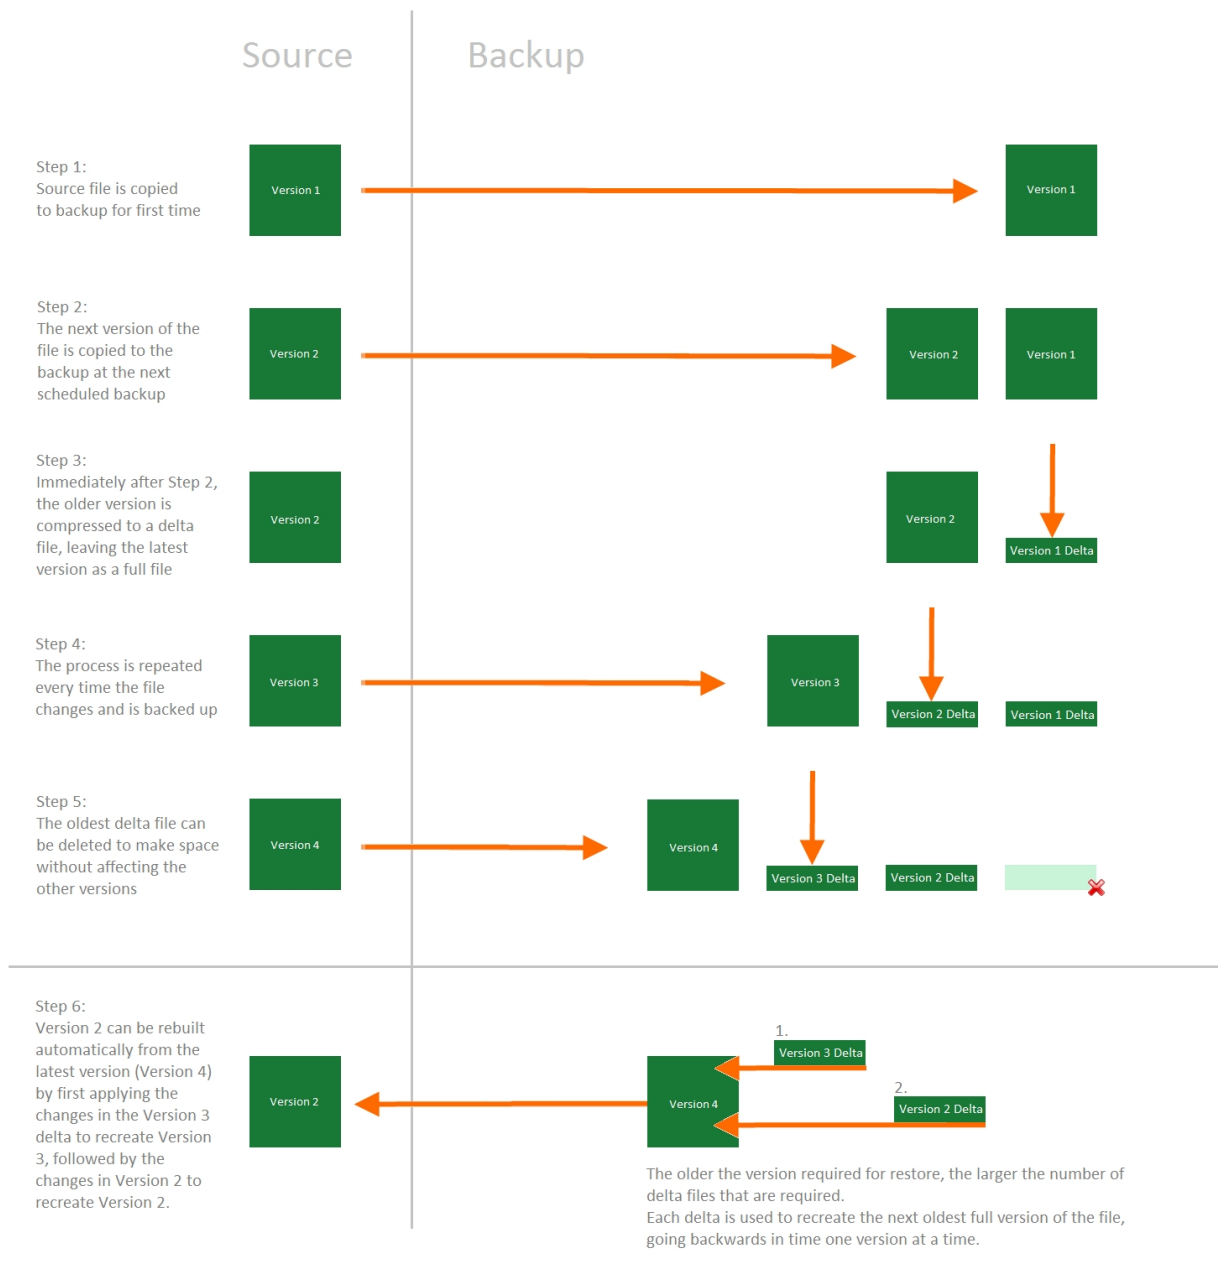

etc.. etc.

If you need to restore the 2:00pm file, then Altaro Hyper-V Backup starts from the 5pm full file, adds on the 4:00pm delta, 3:00 pm delta and finally, the 2:00pm delta. These steps take some time, so this setting ensures that you are never too far away from a full file. This of course happens in the background and is totally abstracted from the user.

With Version 3.0 of Altaro Hyper-V Backup, the recommended value for this setting is around 30.

Visual representation of the Reverse Delta process:

The following image shows the way the process works in 5 steps. Step 6 shows a restoration procedure.

Note:
The full file is usually left in the backup every N versions (4 in this example), skipping the creation of the delta file.

In this way, the the number of delta files that need to be rebuilt in sequence (or "superimposed" on the full file) is limited, avoiding lengthy restore procedures.

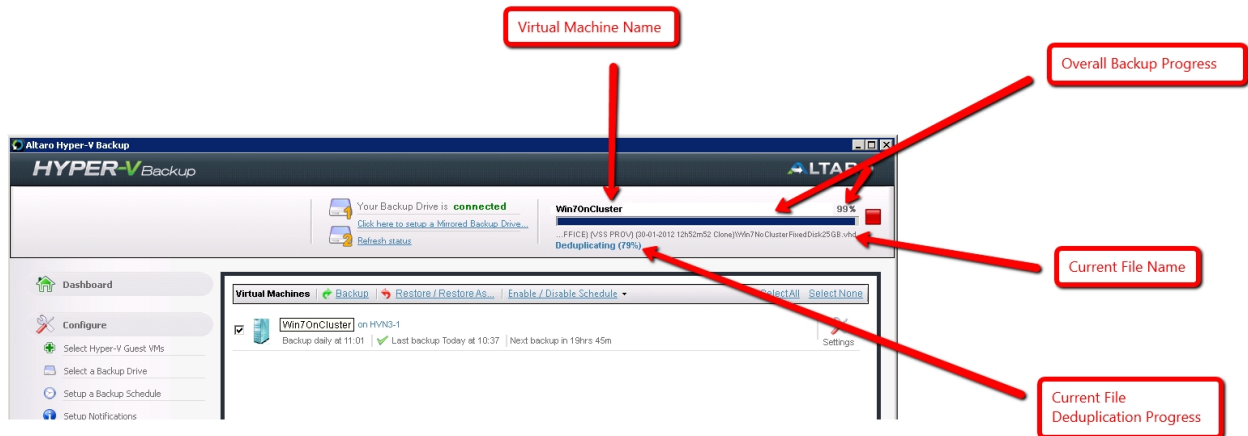

Display of Backup Progress with Reverse Delta

With Reverse Delta Version 2 (available in Altaro Hyper-V Backup version 3.0), the progress bar during a backup now shows further details about the current activity.

The main progress bar will show the current progress of the backup as in previous versions of Altaro Hyper-V Backup. However, when the software is creating a delta file, the main progress bar is paused, and the current “fine grain” progress showing the deduplication (or delta file creation).

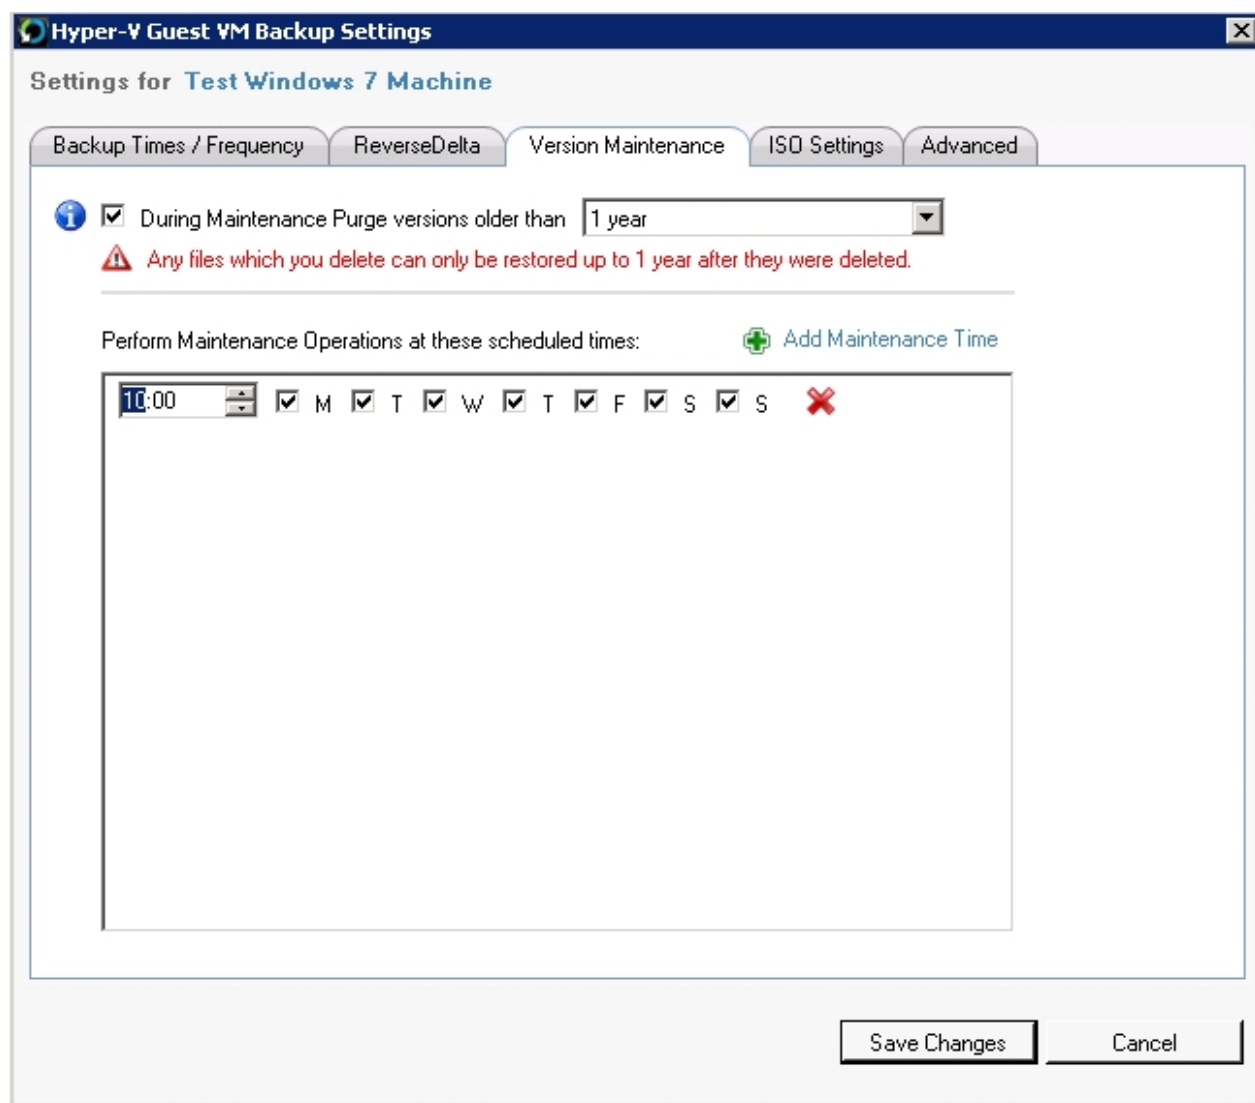

Once the deduplication progress is complete, the next file is started and the main progress bar will resume.

This is shown in the image below:

Version Maintenance

Version Maintenance can be configured using the VM Backup Settings screen as explained [here](#).

Once within the the VM Backup Settings screen select the "**Version Maintenance**" tab and you can choose to limit which old versions to keep by version age. Don't forget to set a version maintenance schedule otherwise maintenance will not run.

You can learn more on how version maintenance works [here](#).

You can also learn on how to manually delete old versions [here](#).

Cluster Support

Altaro Hyper-V Backup supports backing up virtual machines that are running on a failover cluster node, both if they are using cluster shared volumes (CSVs) or not.

Cluster Shared Volumes

Cluster Shared Volumes or CSVs are shared storage devices, usually on SANs and similar hardware, which are accessible from all nodes in a failover cluster. Altaro Hyper-V Backup supports backing up VMs that have data stored on CSVs. This is done by indicating to the Shadow Copy component that a backup of a VM on the failover cluster is about to begin. The node on which Altaro Hyper-V Backup is installed temporarily takes ownership of the CSV and enables redirected I/O. This enables the node to perform a shadow copy operation on the CSV. Once the backup is completed, redirected I/O is

once again disabled.

Read this [chapter](#) for details on how to configure Altaro Hyper-V Backup in a Cluster Environment.

Reports

To view reports simply open the **Management Console** and select the option **[Reports]** from the left hand side main menu.

Read instructions on how to open the Management Console [here](#).

Three Reports are Available:

- [Backup History Report](#)
- [Restore History Report](#)
- [Errors since the last backup Report](#)

Backup History

The Backup History report displays the following information:

- The VM name that was backed up.
- Date and time of the backup.
- The backup status indicating whether the backup succeeded, succeeded with skipped files, or failed.
- The number of files backed up.
- The total size of the data that was backed up.

- The duration of the Backup.

View List of Skipped Files

Double-clicking on a backup which has a warning icon or error icon will bring up a list of files that were skipped during that backup. A reason why the file was skipped is also given.

View List of Backed up Files

Double-clicking on a successful backup will bring up a list of files that were backed up during that backup. Information on whether the file was created, changed, renamed or deleted is also given.

Alternatively you may right-click on a backup to bring up a context menu with all options.

Restore History

The Restore History report displays the following information:

- The VM name that was restored.
- Date and time of the restore operation.
- The restore status indicating whether the restore operation succeeded or failed.
- The duration of the restore operation.

Errors since the last Backup

The Errors report lists any errors that have occurred since the last successful backup. The following information is displayed:

- Date and time of the error.
- A description of the error.
- The error code.

This list will be cleared once the VM causing the error is backed up successfully.

Managing Backup Drives

- [Supported Backup Destinations](#)
- [Configuring Backup Destinations](#)
- [Managing Backup Space](#)

Supported Backup Destinations

The supported Backup Destinations are listed [here](#).

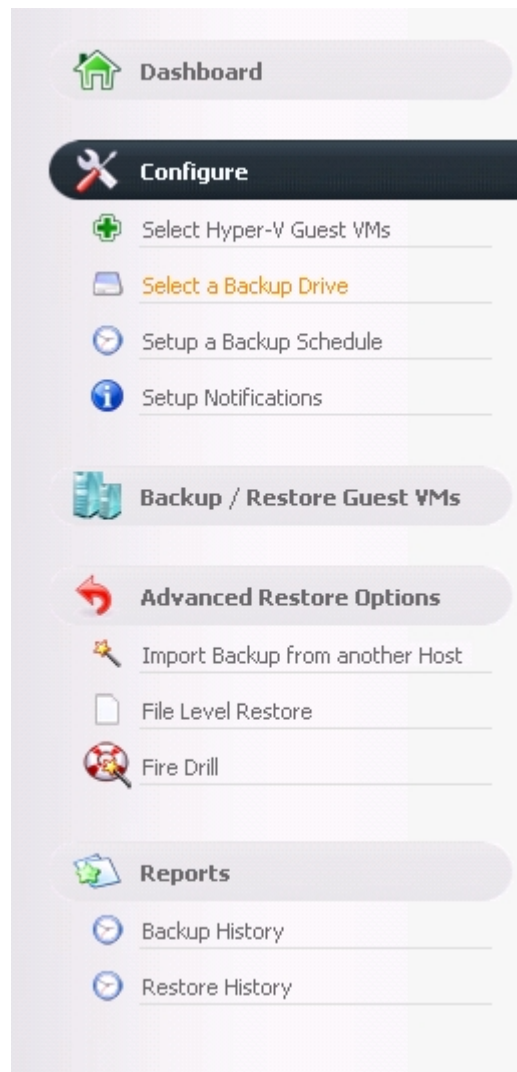

Configuring Backup Destinations

- [Configuring your backup destination](#)
- [Selecting a Backup Drive using the "Backup Drive Selector"](#)
- [Selecting a Network Path using the "Backup Drive Selector"](#)
- [Changing your Primary Backup Drive Selection](#)
- [Multiple Primary Backup Drive Swapping](#)
- [Drive Swap using RDX Cartridges](#)
- [Configuring a Mirror Backup Drive](#)
- [Switching to the Mirror Backup Drive](#)
- [Backup Drives in a Hyper-V Cluster Environment](#)

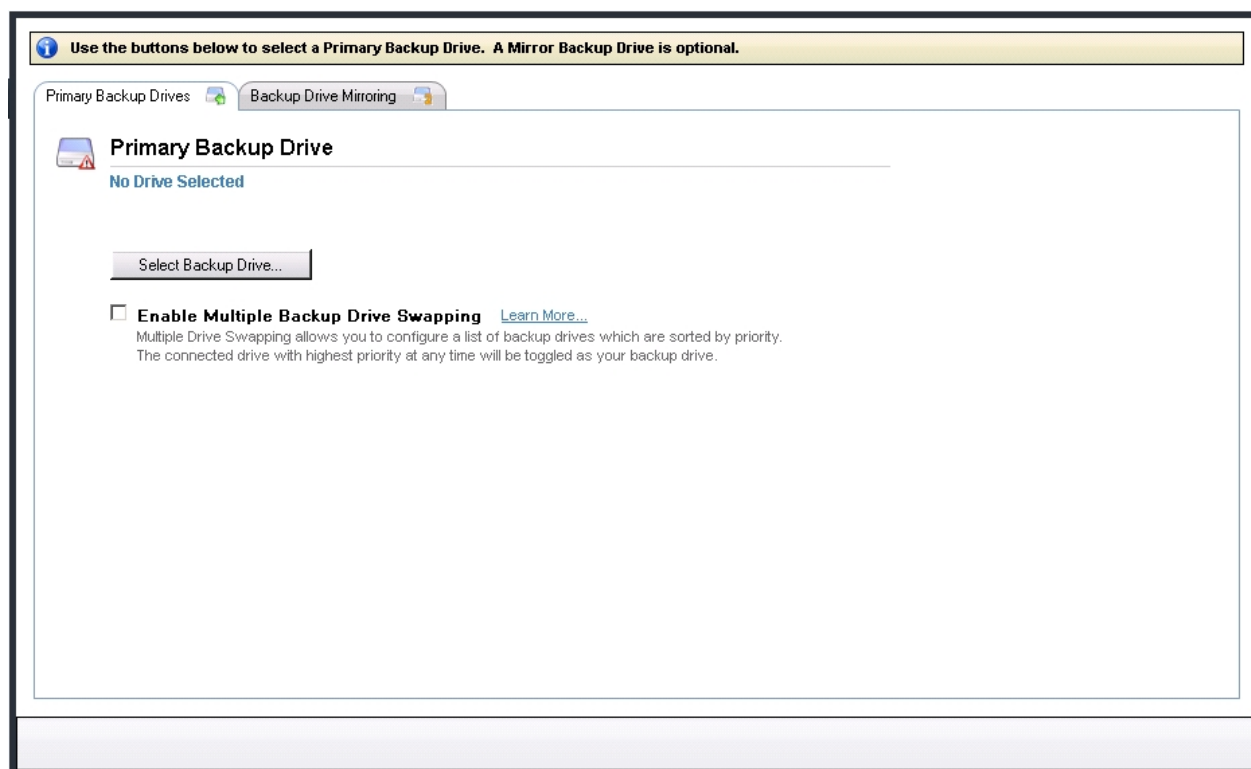

Configuring your backup destination

To select a drive or network path as your backup destination, open the **Management Console** and select the option **[Select a Backup Drive]** from the left hand side menu.

Read instructions on how to open the Management Console [here](#).

Once you select "Select a Backup Drive" you will be presented with the following panel:

The next step is to click on the "Select Backup Drive" button, before configuring any of the other options. This will bring up the "Backup Drive Selector" window described [here](#).

Important Terminology – Please read!

There are various ways the backup locations can be configured. Please read these definitions that are used throughout the rest of this document. Setting up the different configurations will be explained in more detail in the following sections of this document.

Primary drive:

A primary drive is a backup location to which the virtual machine files are copied directly from the host (via a shadow copy of the VM files). Multiple primary drives may be configured, as long as none of them are on a network path. If you specify a primary drive on a network path, then it must be the only configured primary drive.

Drive swapping:

If the primary drive selected is a locally connected drive (USB, eSATA or similar), then you may specify other *locally connected* drives as primary drives. Backing up different VMs to different primary drives is not supported, and all primary drives will contain backups for the same VMs. Only one primary drive can be active at any one time. If more than one primary drive is connected at the same time, the active primary drive will be selected according to a user-assigned priority.

Mirror drive:

If only one primary drive is selected (and this is a requirement if the primary drive is on a network path), then you may specify a *mirror drive* which is a redundant copy of the primary drive. Backup data is always synchronized from the primary drive to the mirror drive, and backup data is never copied to the mirror drive directly from the source files on the host. If the primary drive is not connected, no data can be synchronized to the mirror drive.

RDX cartridges:

A different way of drive swapping, instead of choosing multiple drives and assigning different priorities to them, is by selecting an RDX cartridge enclosure. Any cartridge inserted in the designated RDX enclosure will be used as a primary backup drive.

In summary, these are the possible configuration options available in Altaro Hyper-V Backup:

- 1) Primary backup location is a **network path** (for example “\\Backup-Server\backups”):
 - Drive swapping not supported.
 - Mirror drive is supported.

- 2) Primary backup location is a **locally attached drive**:
 - Addition of other locally attached primary drives for swapping is enabled.
 - Mirror drive:
 - o Only one primary drive selected: Mirror drive is available for configuration.
 - o More than one primary drive selected: Mirror drive is disabled.

- 3) Primary backup location is an **RDX enclosure**:
 - Drive swapping is supported in two ways:
 - o Addition of any locally attached drives including non-RDX drives, but each RDX cartridge must be inserted selected and added independently (as above).
 - o RDX drive rotation only: no other primary drives can be added, but any cartridge inserted in the enclosure will be used as a backup drive without any prior configuration or selection of the cartridge.
 - Mirror drive is not supported.

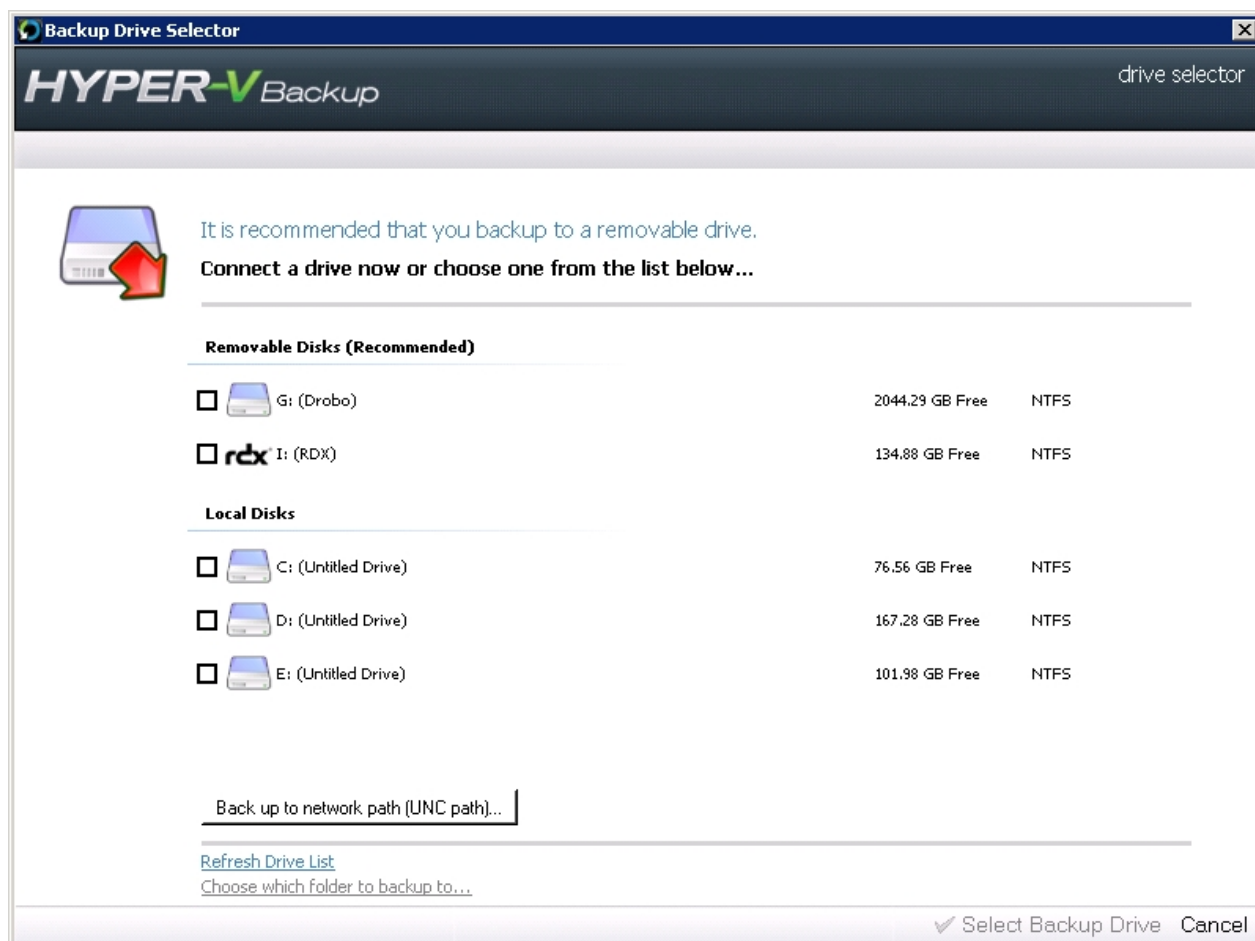

Selecting a Backup Drive using the "Backup Drive Selector"

The Backup Drive Selector will show after clicking the “Select Backup Drive” button [here](#).

However, this window is also used in other areas related to the backup storage options, and other sections further below will refer to this section when required.

This section will describe locally attached storage. For backup locations on a network path, see this [article](#).

This is an example of a typical Backup Drive Selector view:

Removable Disks, which are usually recommended for this purpose over fixed local disks will be grouped together and shown at the top of the window.

Local Disks, although not recommended for backup storage, will still be shown under the heading "Local Disks" and will also be available for selection.

The right hand column will show the free space for each drive, and also the format of the drive, which for the purpose of Altaro Hyper-V Backup is recommended to be NTFS formatted.

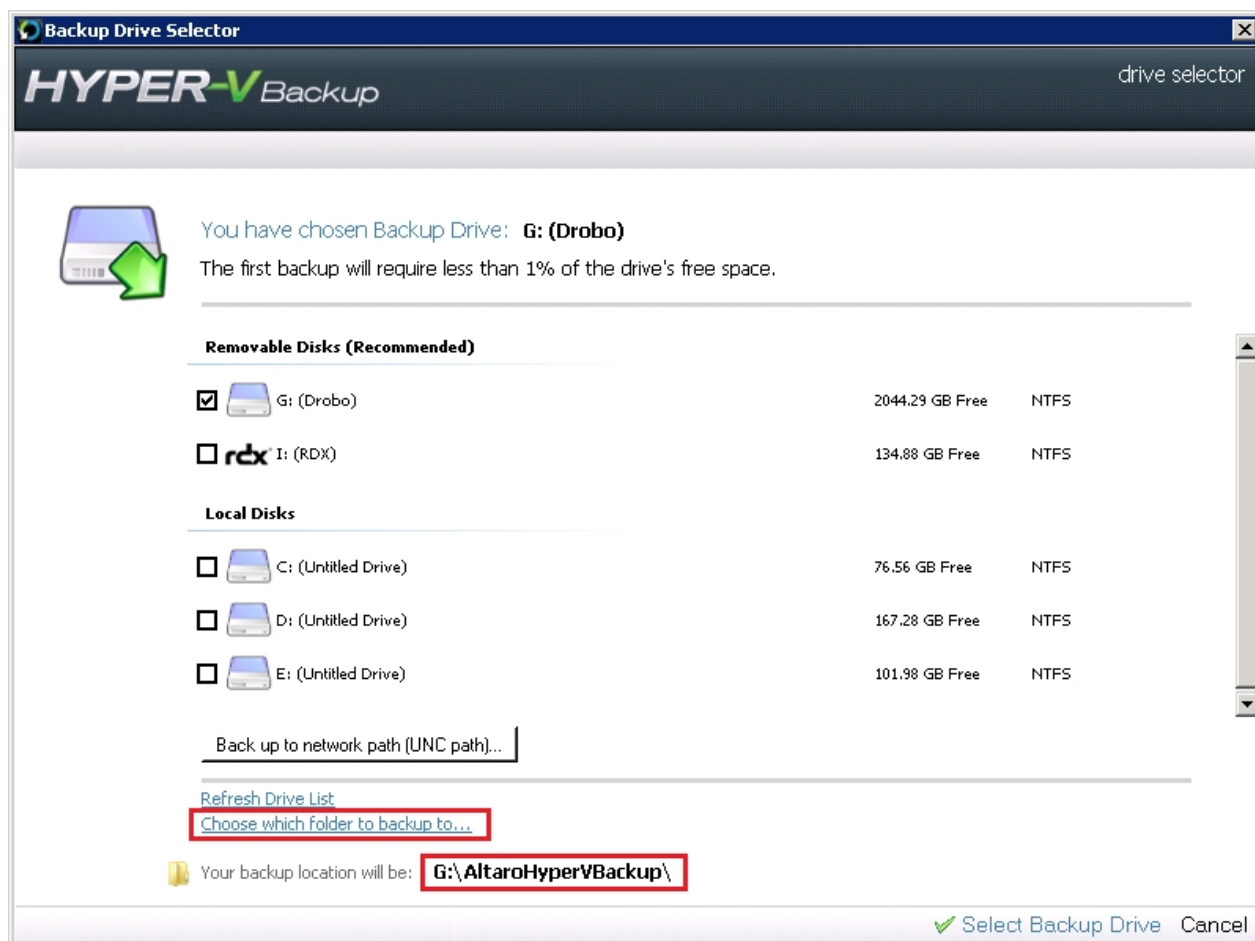

Once you select a drive by clicking on the checkbox to the left of the drive icon, you will see the amount of space on the drive to be used at the top of the window as shown in the example for Drive G: below:

Using the same drive letter in the example above, the destination folder will by default be chosen as **G:\AltaroHyperVBackup**.

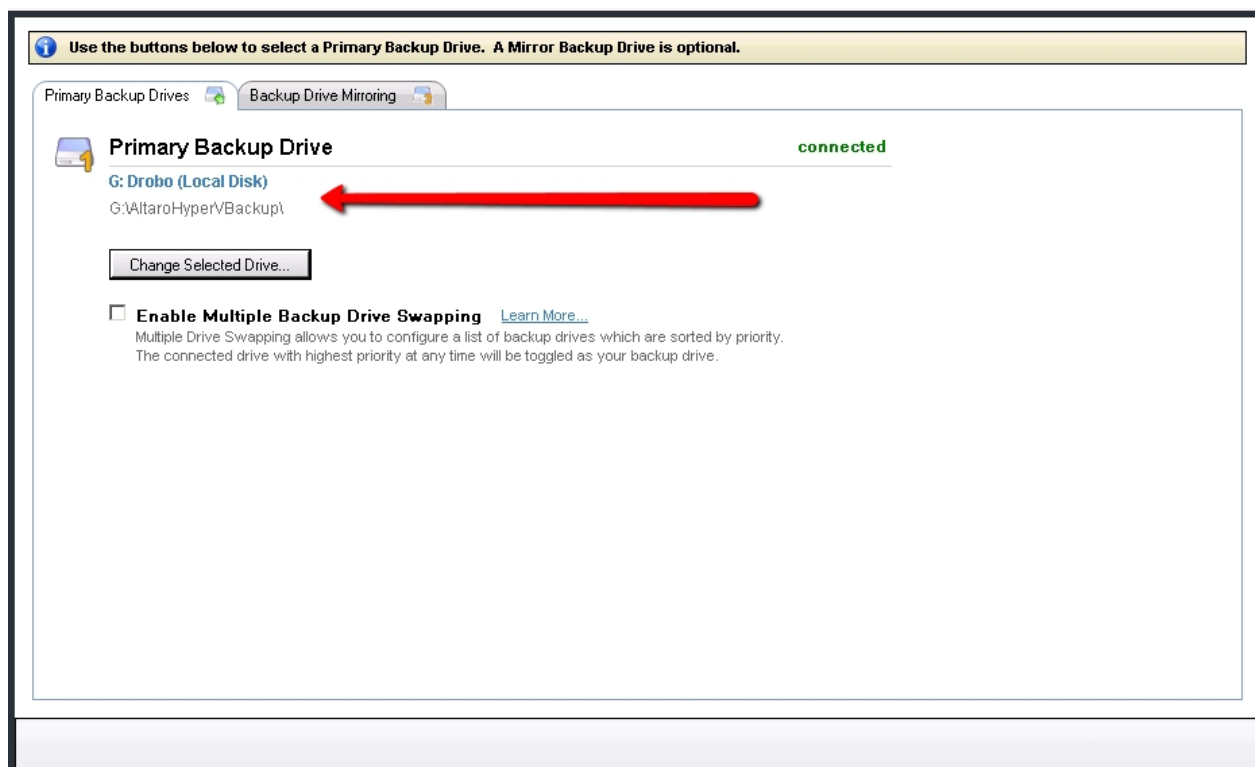

This may be automatically changed to **G:\AltaroSharedFolder\AltaroHyperVBackup** in case the backup location may need to be shared with other nodes on a cluster as described [here](#).

You can change the default backup folder by clicking on the “Choose with folder to backup to” link at the bottom of the window as shown in the image below. Your backup location will be updated in the bold text below the link:

Once you are done, click on the “Select Backup Drive” button at the bottom right of the window.

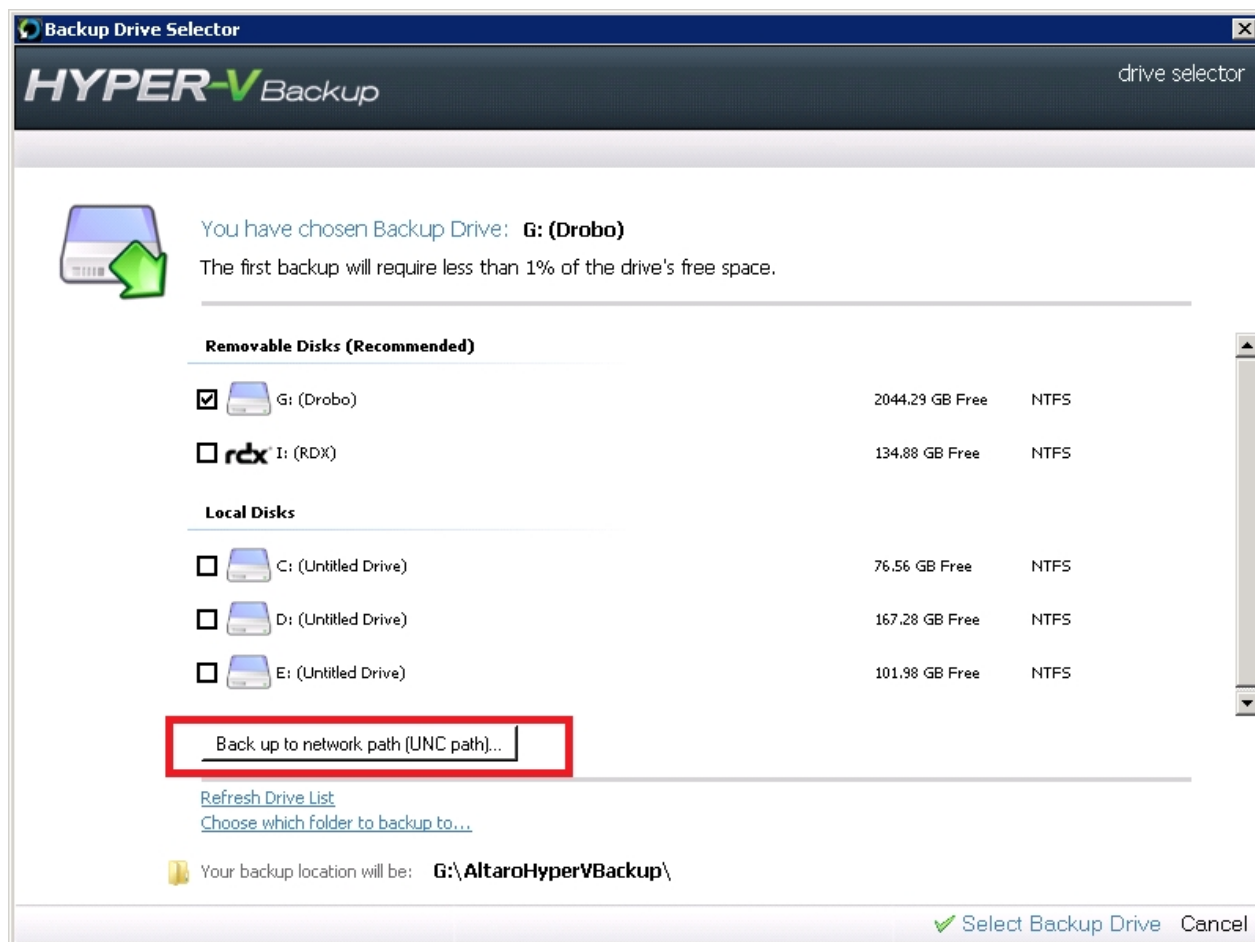

You will be returned to the main drive configuration panel, now showing the drive selected as shown below:

If you have a Hyper-V cluster set up, configuring a locally attached backup location may require an extra step as described [here](#).

Selecting a Network Path using the "Backup Drive Selector"

Selecting a UNC Path as your backup drive is very easy with Altaro Hyper-V Backup. Simply follow the instructions on selecting a backup drive [here](#) but click on the **[Backup up to a Network Path (UNC Path)...]** button when presented with the drive list.

This will bring up the following network path selection window:

Enter a UNC Network Path

HYPER-V Backup

UNC Network Path example: \\Server\Share

Enter Account Credentials to use for Backup / Restore operations:

Domain OR Machine

User Name

Password

Please update these credentials each time that the password expires or changes. You can do this from the Drive Manager screen.

Enter the network path in the topmost field. The supported formats here are:

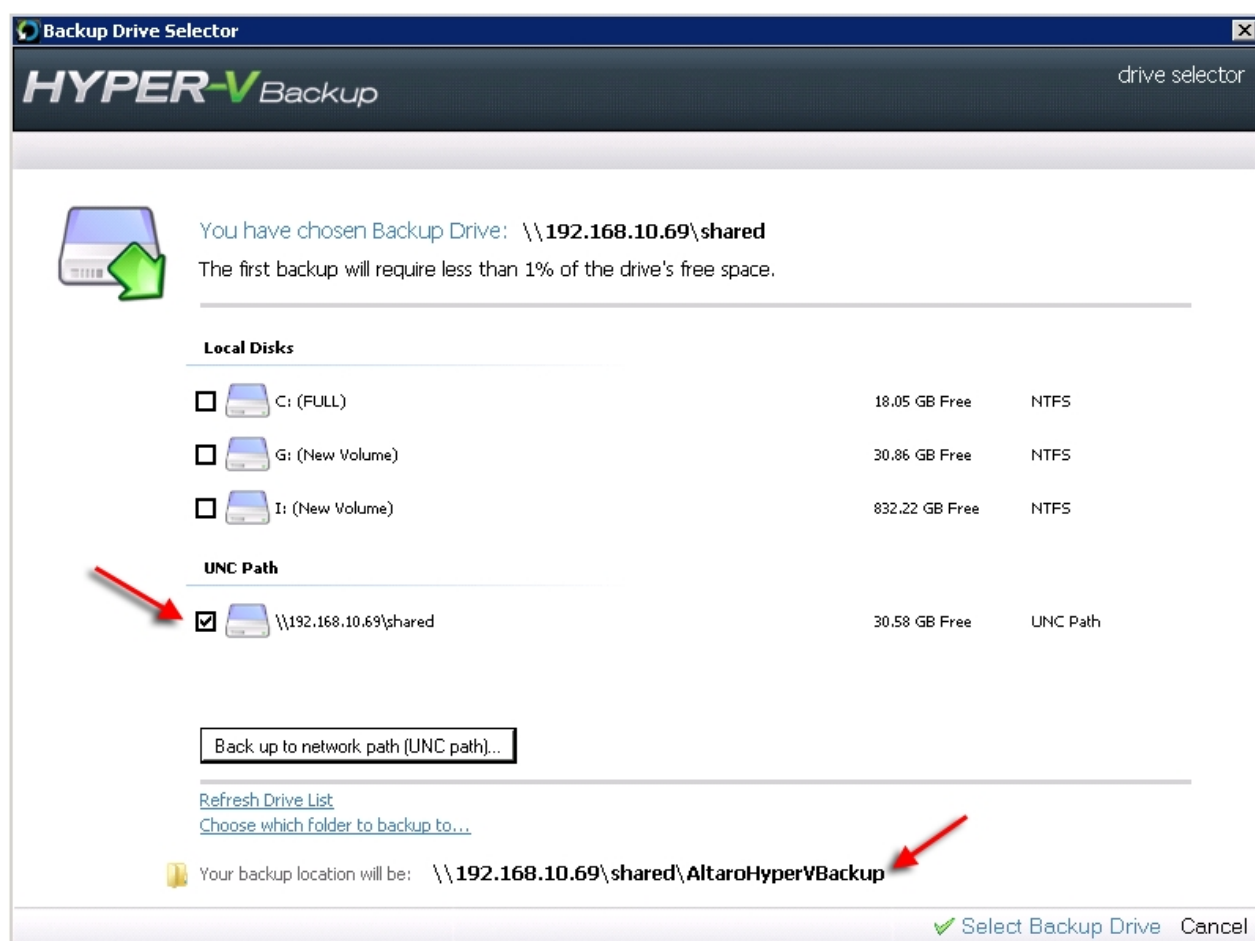

- \\IP Address\Share, for example \\192.168.1.10\Backups
- \\ServerName\Share, for example \\BackupServer\Backups
- Both of the above with one or more extra folders, for example \\192.168.1.10\Backup\Altaro

Entering a server name or IP address alone, for example "\\192.168.1.10" , alone with no share name, is not supported.

In the three lower fields, you must enter the domain name, or else the IP Address, with no slashes, of the backup destination, the username to be used to authenticate to the path, and the password. The password is never stored as plain text in the Altaro Hyper-V Backup configuration files.

An IP address is usually used instead of the domain name when the backup destination is not running Windows or is not part of the domain, for example a NAS drive enclosure or similar.

Once you are done, click on the "Test Credentials" to make sure the authentication works and then click "Add Network Location". This will add the network path as an option in the drive selector window alongside the other detected drives:

You can also select any further subfolders to use for the backup location by clicking on “Choose with folder to backup to” link, as described [here](#).

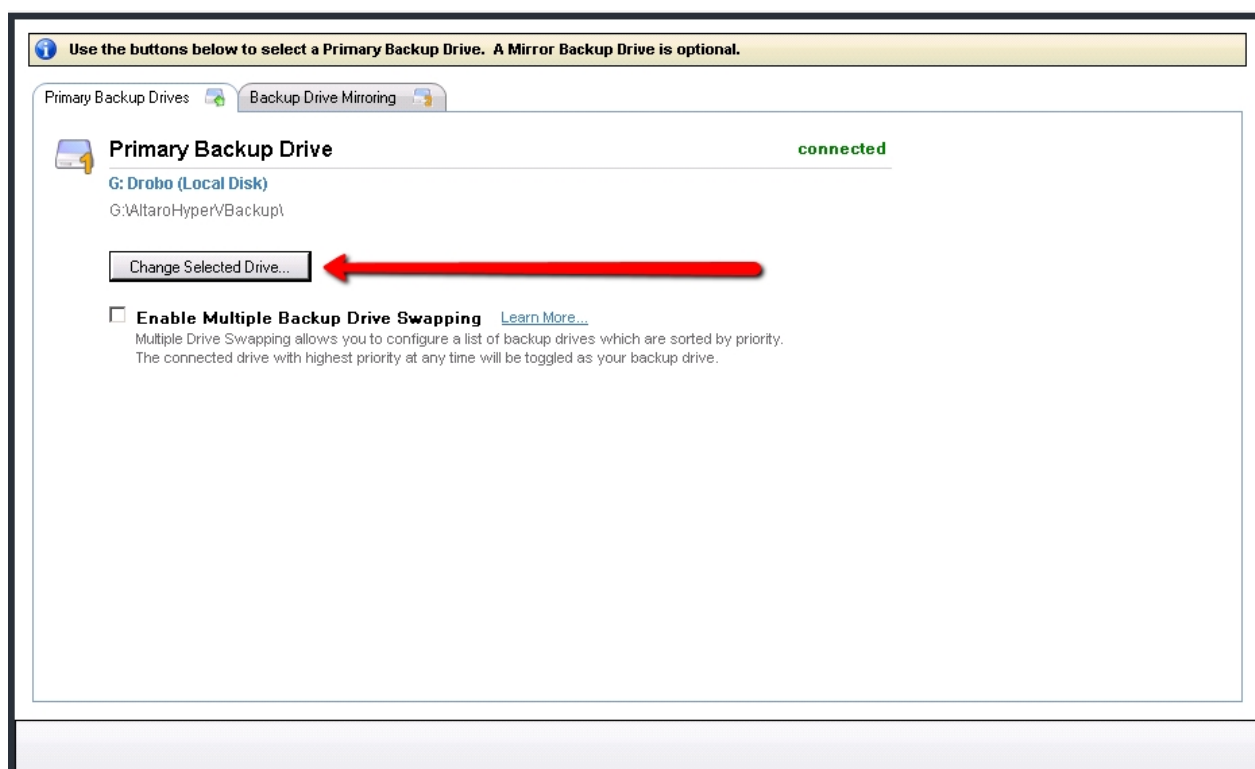

Once you are sure of your selection, click on “Select Backup Drive” at the bottom of the window as described [here](#).

Changing your Primary Backup Drive Selection

If you are using a network path as your primary drive, or you have decided not to use the drive swap feature as described [here](#) and use only one primary drive, you may want to change the drive to another primary drive.

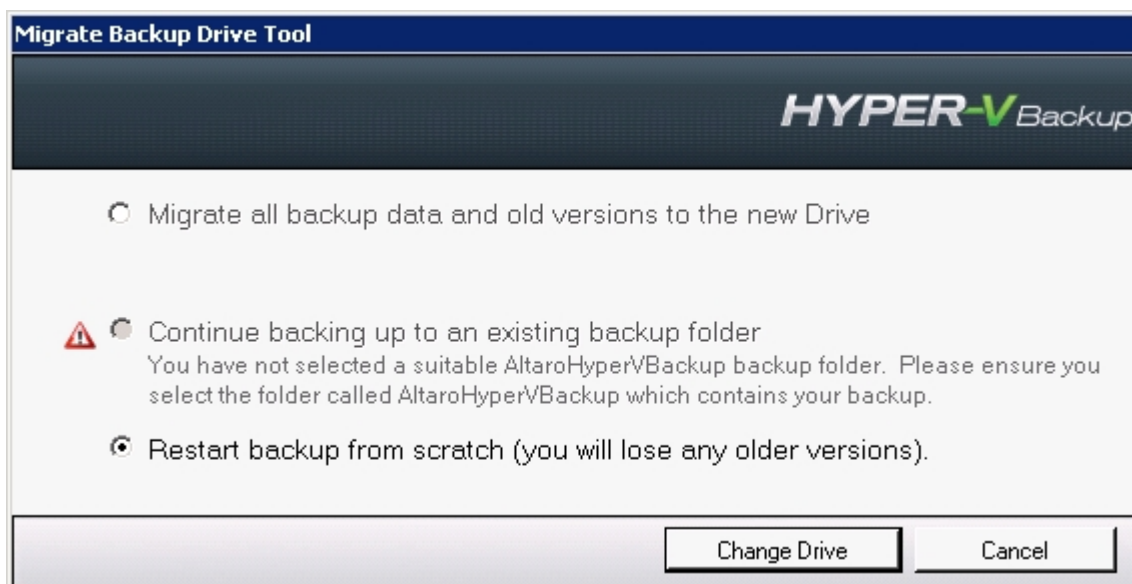

If you are using the drive swapping feature, you may also want to change the currently connected drive to a new location, with the option of migrating all the data as described further below.

To do this, click on the “Change Selected Drive” button shown in the image below:

Clicking the button will display the Drive Selector window, and you can choose an alternative primary drive location, locally attached or on a network path, as described [here](#) and [here](#) respectively.

Once you have chosen the new primary backup drive, you will be prompted with three options as shown below:

The three options are explained below:

1) **Migrate all backup data and old versions to the new drive.**

This option is available when the previously selected primary drive is still available. If you choose this option, all data will be copied over to the new backup location, and the new backup drive will resume

incremental backups seamlessly from the time of the last backup to the previously selected drive.

Please note that the migration procedure may take several hours depending on the amount of data that needs to be transferred. Once the migration is complete, you will be shown the following alert, and from that point on the backups may resume to the newly selected drive:

2) Continue backing up to an existing backup folder

This option is enabled if the software detects that the newly selected primary drive was already used with the same backup configuration. You may choose this option if you would like to resume incremental backups on the newly selected drive, automatically linking to the previous backup available on that drive.

This option is useful when you want to move the location of the primary drive. For example if you have performed the first backup on a drive connected via USB, and then connected that same drive on a shared network path on another computer, you may re-map to the same backup drive using this option.

3) Restart backup from scratch

Choose this option when you do not want to copy any backup data from the previously connected drive (if available) and start the backups on the newly selected drive from scratch.

Multiple Primary Backup Drive Swapping

As described [in more detail here](#):

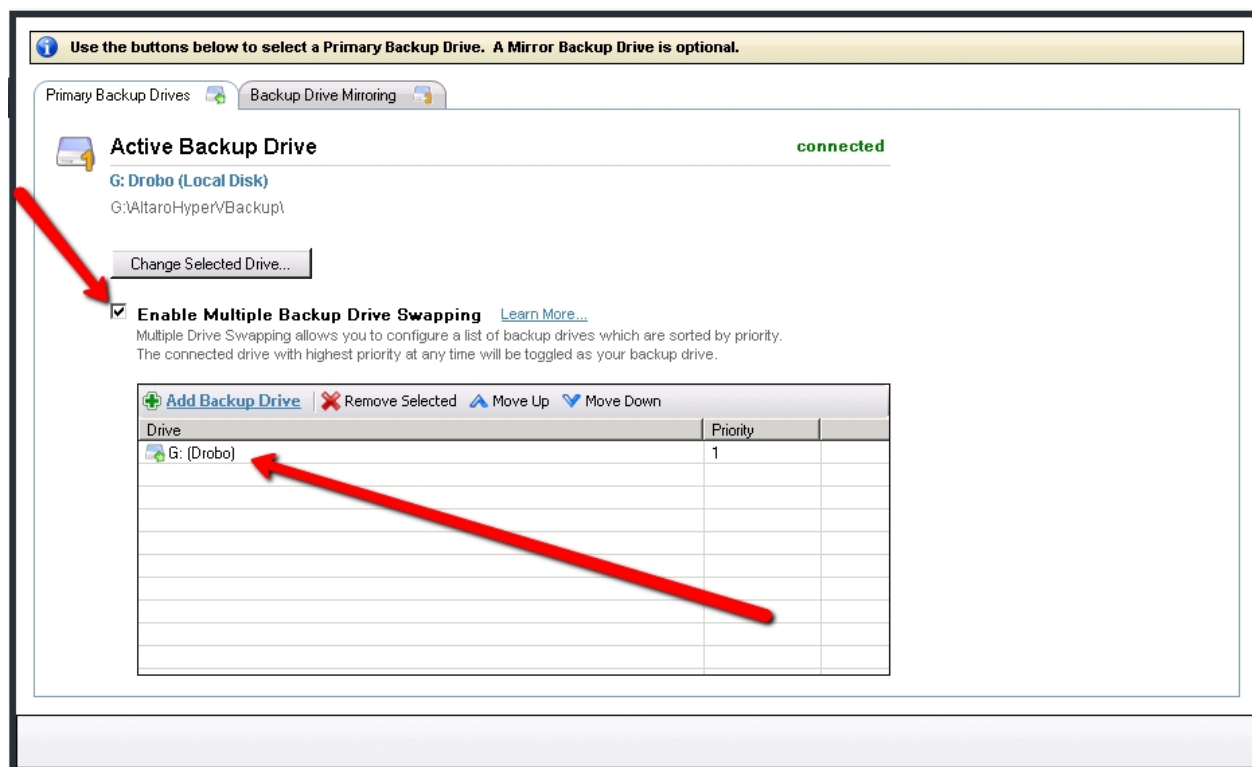

If the primary drive selected is a locally connected drive (USB, eSATA or similar), then you may specify other *locally connected* drives as primary drives. Backing up different VMs to different primary drives is not supported, and all primary drives will contain backups for the same VMs.

Only one primary drive can be active at any one time. If more than one primary drive is connected at the

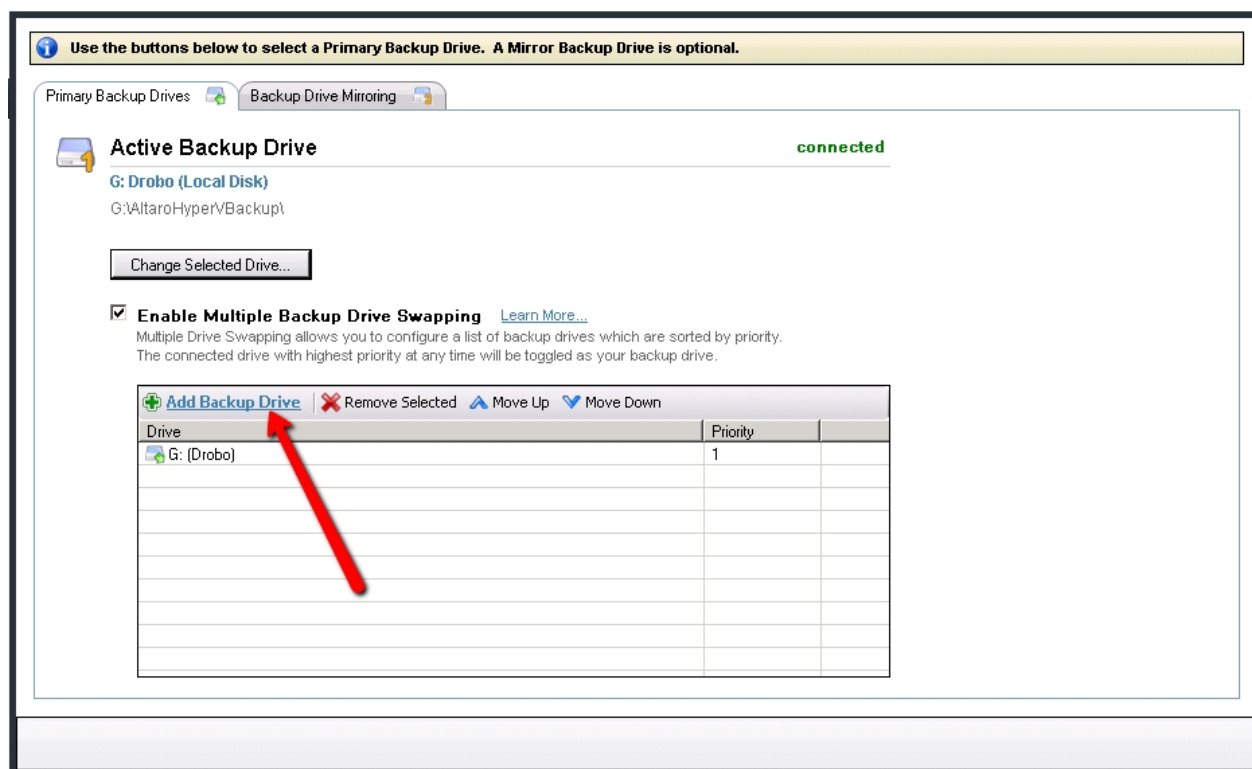

same time, the active primary drive will be selected according to a user-assigned priority.

To enable multiple primary drive swapping, first click on the “Enable Multiple Backup Drive Swapping” checkbox.

If you have already selected a network path as your primary drive, this checkbox will not be enabled. If you have already selected a locally connected drive as your primary drive, the checkbox will be enabled, and a list of drives will appear below the checkbox, showing the primary drive that has already been selected:

To add another primary backup drive, please click on the “Add Backup Drive” button as shown below.

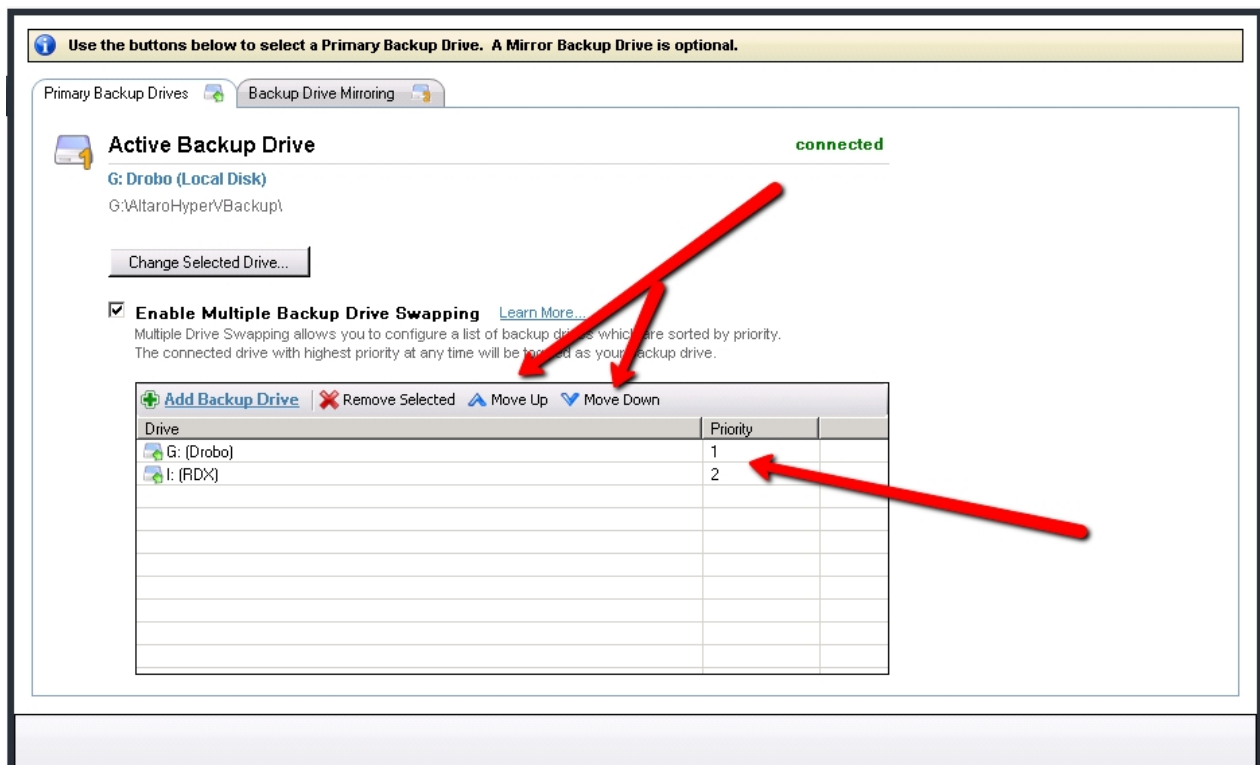

Clicking on the “Add Backup Drive” button, will bring up the **Drive Selector Window**. Please follow the procedure described [here](#) in order to choose another primary drive. Please note that selecting a network path will be disabled in this case.

You may repeat this procedure multiple times in order to add any number of primary drives. You may also add and remove primary drives at a later stage.

Only one primary backup drive may be active at any one time, so once the other primary drives have been selected, you must specify which drives will be activated if more than one primary drive is simultaneously connected. This is done by moving the drives' position up or down in the list in order to change their priority. A drive with a *lower number* in the priority column will be preferred over a simultaneously connected drive with a *higher number* in the column.

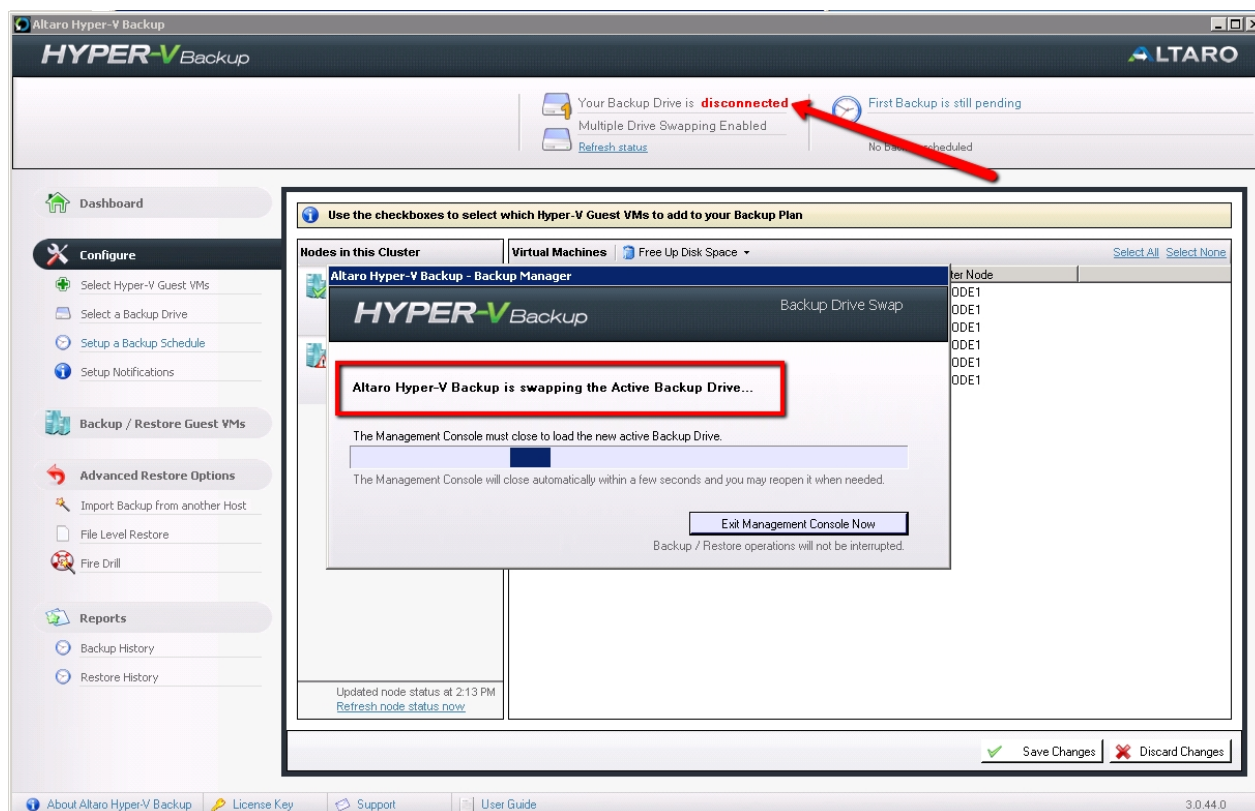

In other words, the drive with *Priority 1* will have a higher priority over any other selected primary drives. To change the relative priority of the drives, click on any one of the drives in the list and then click on the “Move Up” and “Move Down” buttons at the top of the list as shown in the image below:

The currently active drive is switched to another drive in two cases:

- 1) A drive with a higher assigned priority is connected.
- 2) The currently connected drive is disconnected and a drive with a lower priority is available.

If one of the above occurs, you will see the following alert appear if the Management Console is open:

After a few seconds, the Management Console (if open) will automatically close in order for the new drive details to be loaded. In the current version, the Management Console will not reopen automatically, and must be launched again by the user if required.

Once you reopen the Management Console, you will only see the backup history of the newly activated drive.

Please keep in mind that each independent primary backup drive will contain backup versions corresponding to different times, and no two primary drives will contain the same backup versions.

The backup history in the Management Console will change according to the active primary drive, and whilst a drive is active, the backup versions that are available for restore will only be for those backups that were done on the when the currently active drive.

Drive swap using RDX Cartridges

A different way of drive swapping is by using an RDX drive enclosure. If the first primary drive you choose is an drive within an RDX enclosure, this feature is automatically enabled.

RDX enclosures are distinguished by the RDX logo beside the drive letter in the Drive Selector window as shown below:

You have chosen Backup Drive: **I: (RDX)**

The first backup will require less than 1% of the drive's free space.

Removable Disks (Recommended)

☒ **rdx** I: (RDX)

134.88 GB Free

NTFS

Local Disks

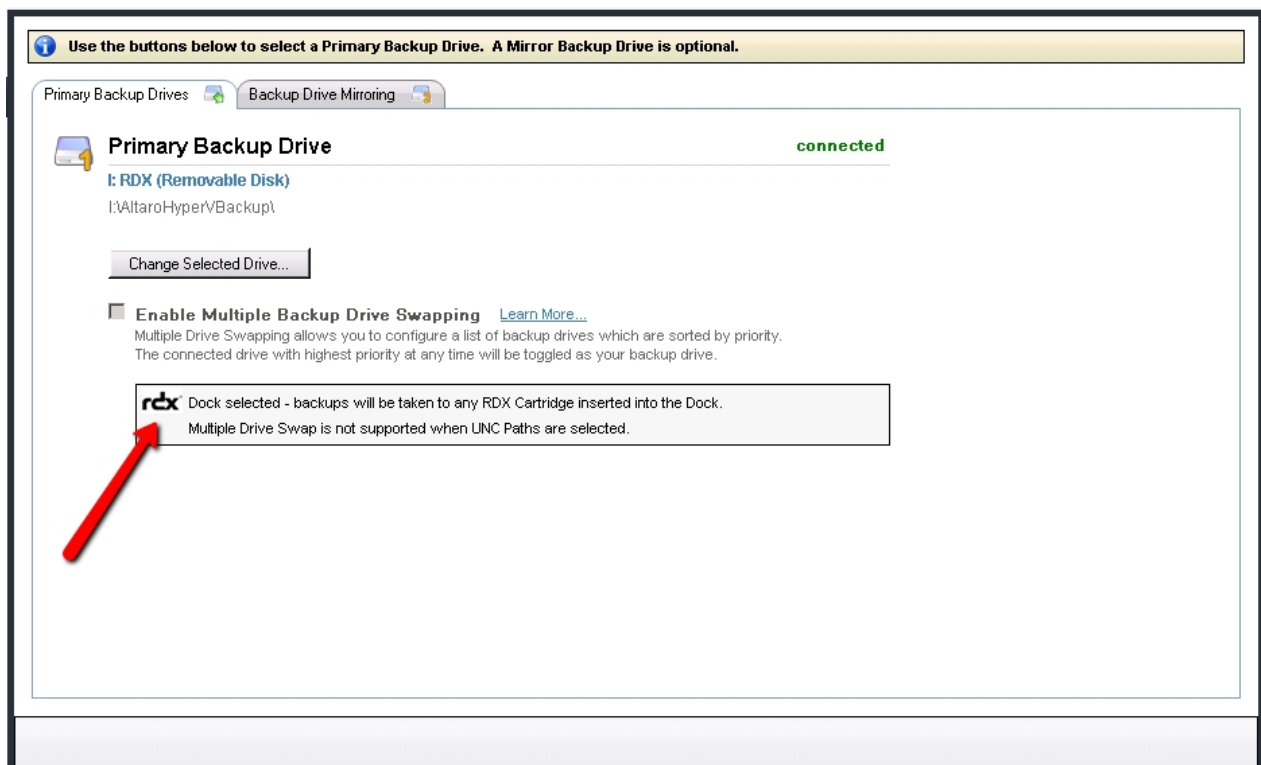

☐ C: (Unlabeled Drive)

76.56 GB Free

NTFS

If [drive swapping](#) is not enabled, then the RDX drive rotation feature becomes active and any cartridge inserted into that enclosure is used as a primary backup location without explicitly selecting each drive independently as with the standard drive swapping feature.

When the feature is enabled, the "Enable Multiple Backup Drive Swapping" checkbox and the "Backup Drive Swapping" button are automatically disabled. You will see the RDX logo in the drive configuration panel as shown below:

As with the standard drive swapping feature, please keep in mind that each independent RDX cartridge will contain backup versions corresponding to different times, and no two cartridges will contain the same backup versions.

The backup history in the Management Console will change according to the active cartridge, and whilst a cartridge is active, the backup versions that are available for restore will only be for those backups that were done on the when the currently active cartridge.

Note:

In order to revert to standard [drive swapping](#), you will need to select the first primary drive as a non-RDX drive (as described [here](#)). Once drive swapping is enabled, you can then re-add the RDX enclosure as one of the primary backup drives, but only the currently inserted cartridge will be added to the list of multiple drives. You can add multiple RDX cartridges to the list by inserting them, selecting them and assigning their priority in turn.

If an RDX Cartridge is rotated while the Altaro Hyper-V Backup Management Console is open then the console must restart itself in order to attach to the new cartridge. In this case the user will temporarily see the following loading screen. This should only take a few seconds.

Configuring a Mirror Backup Drive

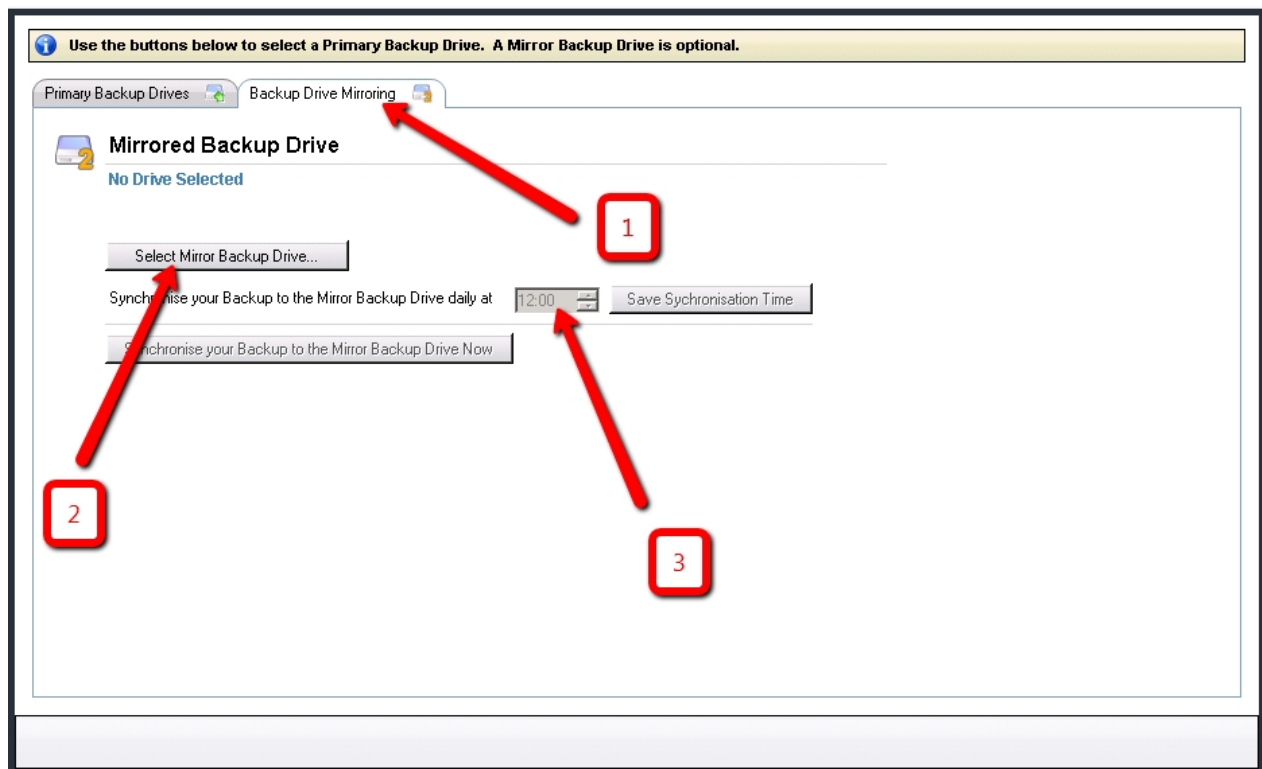

If you are using a network path as your primary drive, or you have decided not to use the [drive swap feature](#) and use only one primary drive, then you have the option of assigning another drive as a mirror drive. As described in [here](#), a mirror drive is a redundant copy of the primary drive.

Backup data is always synchronized from the primary drive to the mirror drive, and backup data is never copied to the mirror drive directly from the source files on the host. If the primary drive is not connected, no data can be synchronized to the mirror drive.

To select a mirror drive, follow the following steps:

- 1) Click on the "Backup Drive Mirroring" tab at the top of the drive configuration panel
- 2) Click on the "Select Mirror Backup Drive" button. Then follow the "Drive Selector" procedure as described in [here](#) and [here](#) to choose a locally attached or network mirror drive respectively.
- 3) You can then set a time (once per day) at which the drive synchronization from the primary backup drive to the secondary backup drive will take place automatically. Please note that until the synchronization is ready, **no backups will take place**. The synchronization will only start **if the primary drive is connected**.

The three steps above are shown in the image below:

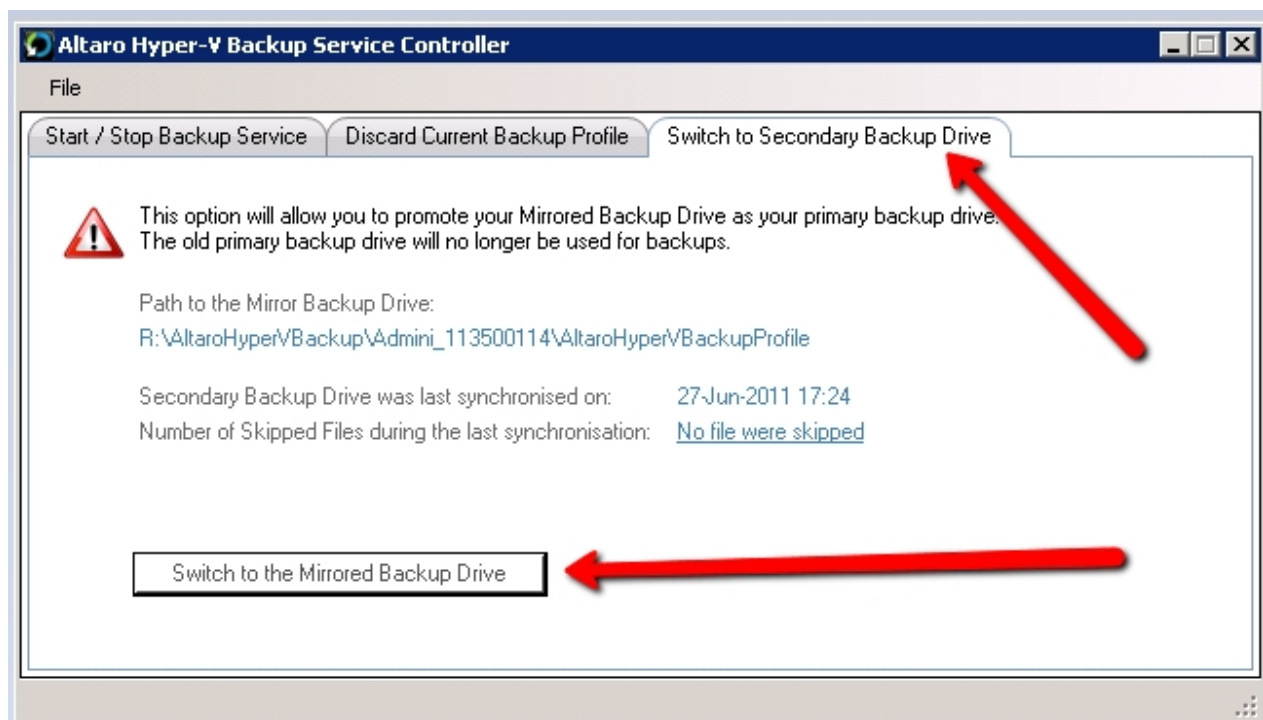

You may start the synchronization manually at any time by clicking on the “Synchronize your Backup to the Mirror Drive” button in the image above.

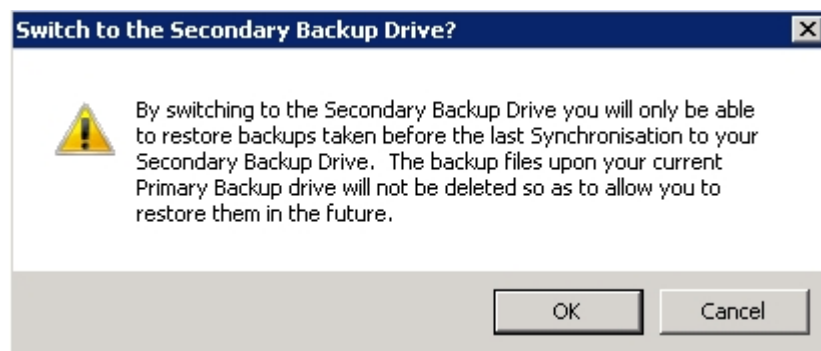

Switching to the Mirror Backup Drive

To switch to the Mirror Backup Drive simply use the "Switch to Mirror Backup Drive" tab in the **Altaro Hyper-V Backup Service Controller**. You can learn how to access the service controller [here](#).

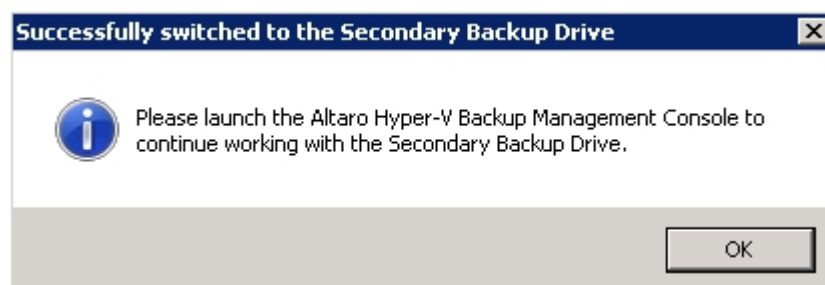

Switch to Mirror Backup Drive: This tab allows the user to discard the current backup profile and import the backup profile saved on the Mirror backup drive. Once the backup profile is switched Hyper-V Backup will treat the Mirror backup drive as the primary backup drive.

Once the "Switch to Mirror backup drive" button is clicked then the user will be prompted to confirm.

Once the switch is performed successfully then the user will be notified.

Important Note: Should the switch fail then you will find a backup of the old profile folder as follows:

C:\ProgramData\Altaro\AltaroHyperVBackupProfile_BACKUP_TimeStamp

Simply rename this backup to:

C:\ProgramData\Altaro\AltaroHyperVBackupProfile

You may need to stop the service first as explained [here](#).

Backup Drives in a Hyper-V Cluster Environment

If you have a Hyper-V cluster set up, Altaro Hyper-V Backup will communicate with other cluster nodes and instruct them to back up any selected VMs to the same backup location.

If your primary drive is a network location, the network path credentials are securely communicated to the other cluster nodes so that they can authenticate to and access the backup location.

If on the other hand, your primary drive or drives are locally attached drives such as USB drives etc., then the backup folder on those drives are automatically shared using Windows file sharing, so that the other cluster nodes will have access to the backup location.

When this setup is detected, an extra configuration window is shown after selecting the drive from the [Drive Selector window](#).

A node named "Ada nSha edFn de glnahthma scc seated at the tpmm nt over it the recsted backup location, and this folder is shared using standard Windows File Sharing.

You will be prompted with the following window:

Share Backup Drive for other Cluster Nodes

A Hyper-V Cluster Environment has been detected

For Altaro Agents which are installed on other nodes to be able to backup to this backup drive then the backup drive must be shared.

Folder to Share

G:\AltaroSharedFolder

☐ Access Share using IP Address instead of Node Name

NOTE: Use this option only if you want to force the backups to run over a specific IP.

Specify a User Account

☒ Automatically create user account HYPER\Altaro070948

☐ Choose a User Account

User Account Credentials

Domain OR Machine

User Name

Password

Please update these credentials each time that the password expires or changes. You can do this from the Drive Manager screen.

Share Backup Folder **Do Not Share**

At the bottom, the domain is entered as "Hyper-V". This refers to the Active Directory Domain User that will have access (both Share access and NTFS security permissions) to the newly created share.

As shown in the image above, you can simply leave it in the hands of Altaro Hyper-V Backup to create a special Active Directory Domain User for this purpose (Altaro070948 in the example above).

The created share will be accessible only by this user, and the randomly generated credentials will be securely communicated to the other Hyper-V nodes when backup is required on another node.

The newly created share will only be accessible by the newly created user.

If you prefer to specify an already existing user, click the "Choose a User Account" button and specify the credentials as shown in the image below:

Other settings - speed of recovery:

With Hyper-V cluster setups, the cluster nodes may be connected to a Gigabit or faster network, typically fibre channel, on which the Cluster Shared Volumes are set up. This is usually independent of the standard domain network (the management network), which may not reach the same speeds.

What this means is that a remote cluster node may reach the shared backup drive using one of two networks, one possibly being much faster than the other. If you would like to specify which IP the remote cluster node should use in order to access the locally connected backup drive, you may select the checkbox shown in the image below and specify the required IP.

Share Backup Drive for other Cluster Nodes

A Hyper-V Cluster Environment has been detected

For Altaro Agents which are installed on other nodes to be able to backup to this backup drive then the backup drive must be shared.

Folder to Share

G:\AltaroSharedFolder

☒ Access Share using IP Address instead of Node Name 192.168.10.1

NOTE: Use this option only if you want to force the backups to run over a specific IP.

Specify a User Account

☐ Automatically create user account HYPER\Altaro070948

☒ Choose a User Account

User Account Credentials

Domain OR Machine

User Name administrator

Password xxxxxxxxxxxx

Please update these credentials each time that the password expires or changes. You can do this from the Drive Manager screen.

Share Backup Folder **Do Not Share**

If you do not specify this setting, the IP address of the current node (on which the backup drive is shared) will be resolved using the node name on the remote cluster node.

Managing Backup Space

- [Limiting the age of older versions \(Automatic Version Maintenance\)](#)
- [Manually deleting older versions \(Manual Version Maintenance\)](#)
- [Delete Backups of VMs that have been removed from your Backup Plan](#)

Limiting the age / size of Older Versions (Automatic Maintenance)

During each backup Altaro Hyper-V Backup stores the **latest version** of all files as a complete mirror copy. In fact, the backup destination may be accessed simply through Windows explorer and the latest backup may be browsed manually.

Whenever a file changes (or is deleted) from the source data, the older version (or deleted file) is then moved to the "old versions" repository. Over time this "old versions" repository will continue to grow as files keep on changing and more versions are stored. Altaro's **ReverseDelta** technology compresses older files to reflect only changes between one version and another, while still leaving the latest version as a full copy. This ensures that minimal space is required for the "old versions" repository. (See the section about [ReverseDelta](#) in this manual).

As shown in the image below, the Restore Console shows the backup history allowing you to choose which version to restore:

SQL Server

☒ **Restore the version which was backed up on:**

☐ Restore to original location (this will overwrite the current guest VM)

☐ Restore as clone to a different location (this will restore the backed up guest VM as a new VM)

10 June 2011 17:45:29

10 June 2011 17:45:29

10 June 2011 16:57:57

Altaro Hyper-V Backup gives you the possibility of restoring a Hyper-V Guest VM to the exact state it was at the specified timestamp.

Each version contributes to the size of the total backup set on the backup drive. This increase in size is dependent on the nature of the changes that occurred between that backup and the previous one. The way Altaro Hyper-V Backup controls the increase in size is by referencing unchanged files across snapshots to the same data on the disk, and also by making use of delta technology in order to store only the changes within a file from one backup to the next.

Old versions may be deleted from the backup set, with the limitation that versions **can only be deleted contiguously starting from the oldest available version**.

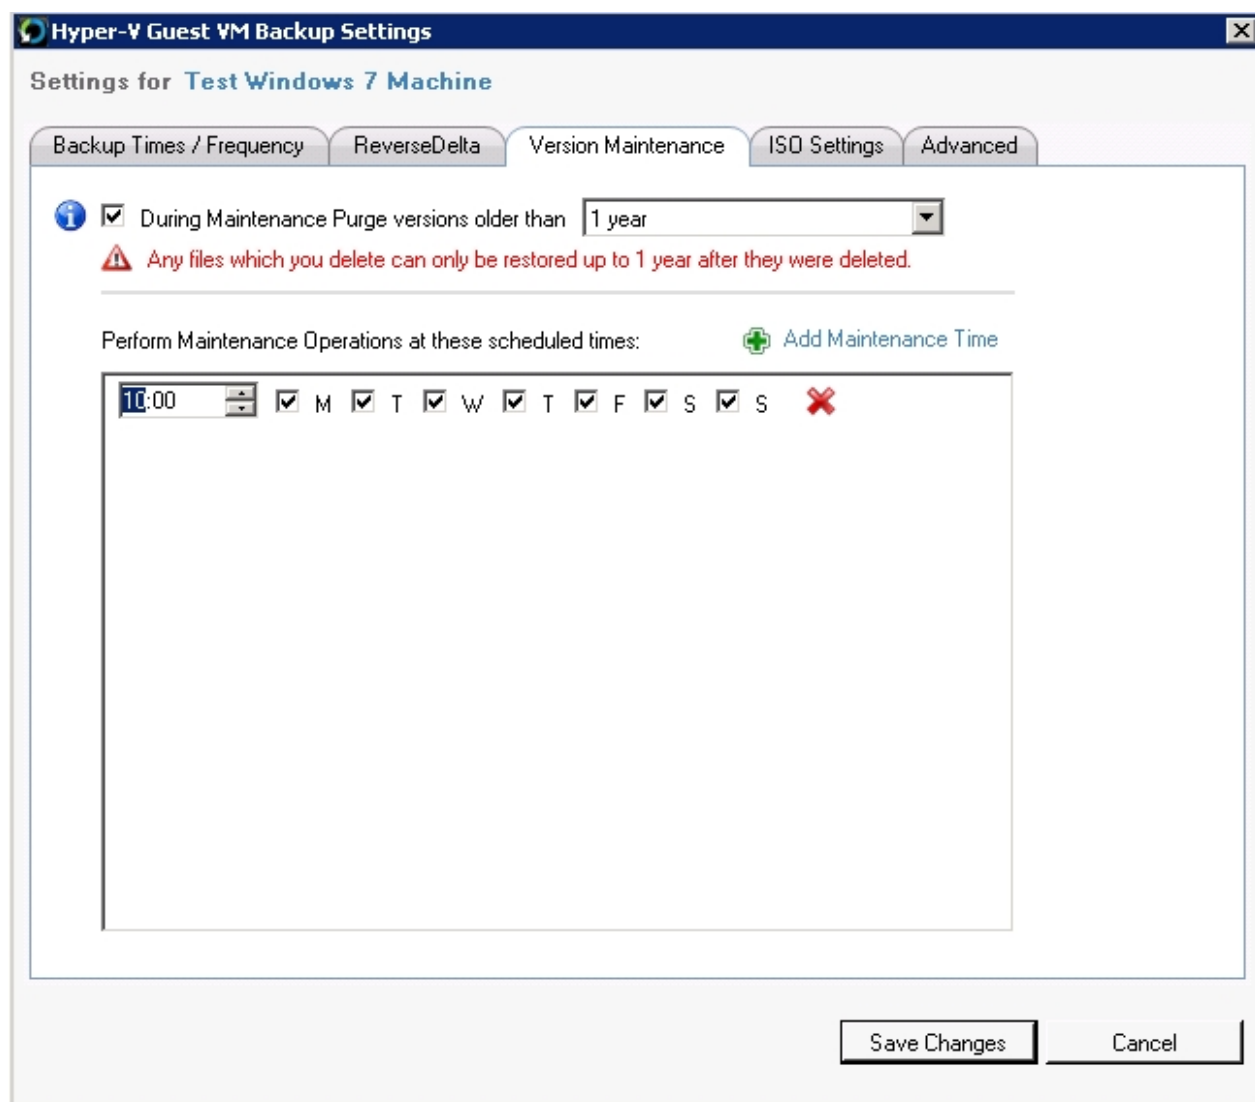

Some users may want to perform periodic maintenance their "old versions" repository to ensure that it does not exceed a certain size limit or contain old and obsolete versions. There is one ways to limit the backup size in Altaro Hyper-V Backup:

- Limit the **age** of the oldest file versions that are stored on the backup drive.

This can be taken care of automatically by setting a Maintenance Schedule. You can learn on how to do this by reading this [section](#).

The Version Maintenance tab shows a checkbox and also a schedule manager below it. The checkbox enabled or disables maintaining your versions by age.

For maintenance to work in the background you need to specify scheduled Maintenance Times. Click on the "Add Maintenance Time" at the bottom of the window and specify any number of times per day you want the maintenance to be performed. Each specified time may be scheduled to run on any number of days of the week as shown in the image below, for example a 17:00 maintenance schedule from Monday to Friday following and a 12:00 schedule on weekends:

You may click on the red “X” next to any scheduled time entry to remove that entry. Please remember to click “Save” at the bottom of the window each time you make changes to the Advanced Settings.

Maintenance by Age:

Select the checkbox “During Maintenance Purge versions older than...” and choose a time span from the dropdown list.

As an example, let's assume today's date is the 15th January 2010 and I set my age limit to 2 months. This would mean that any backups older than the 15th November 2009 will be deleted from the backup drive. This does not happen immediately, but will be done by a maintenance routine within Altaro Hyper-V Backup according to the maintenance schedule you specify (see above).

The latest version of each file will never be deleted even if the size limit remains exceeded after all the older versions are deleted. The latest backup must perfectly mirror the source data, and deleting any files from the latest backup would of course result in an incomplete backup. It is up to the user to select a backup destination that can hold at least one version of each VM.

Common Questions:

Will maintenance ever delete all versions of a backed up file?

The maintenance operations will never delete all versions of a file, unless a file had been deleted from your Server for a period longer than the maintenance period set. Therefore using the same example, you have chosen to delete all versions older than two months and a particular file was deleted from your Server say three months ago.

Since that file was not present at any of the points in time displayed on the timeline then the file can no longer be restored by Altaro Hyper-V Backup from the Restore Console.

What is the end result of maintenance being activated?

The result of all of the above is that, assuming that the changes to your data are more or less similar between one backup and another, this will result in the backup size levelling off as shown in the image below.

This is because as one backup is added to the stack on the timeline, an older one is deleted, **so your backup window is always the same age or size**, moving forwards one day at a time. This levelling off is of course only seen when the oldest backup hits the limit set by the maintenance schedule.

Please note that if you have no Maintenance Schedule for quite a while, and then set the cut-off point to a point in time that is considerably "younger" than your oldest backup, you will see a dip in the size as shown in the graph below, as several backups in the timeline are purged simultaneously. You should then start seeing some levelling off in size thereafter.

Remember that the levelling off assumes that daily changes are fairly similar. If you add substantial amounts of data then you will still see an increase in the size of the graph. With regards to the renaming of folders, deleting of files etc. the files will remain in the backup history until they are flushed out by the maintenance schedule.

How do I find the right setting for my Maintenance Schedule?

Sometimes, trial and error is required to find the right balance between available disk space and age of versions to keep. Here at Altaro, we recommend that if drive space on your backup drive becomes an issue, start with a high setting, which is just below the age of your oldest backup. For example, if you have versions going back 3 months set the setting at 2 months. Next wait until your backup size is maintained and you see a dip in size in the graph.

If after a few days you realize that drive space is still an issue, set the Maintenance Schedule to a shorter time-window, and keep going until you achieve the desired balance.

Manually deleting older versions in the backup set (Manual Maintenance)

The **Altaro Hyper-V Backup Drive space manager** is a simple utility that can be used to clear out old versions from your backup drive. This utility will free up disk space and will also be presented to the user in the case that their backup drive is full or will soon be full.

To access the utility:

1. Open the Altaro Backup Hyper-V Management Console. (Instructions [here](#))
2. Click on the Reports Tab on the left hand side of the screen.
3. Choose the "Backup History" report.
4. Click on "Delete old backups..." from the top right of the report.

Backup History for All Hyper-V Guest VMs

VM Name	Time	Result	Summary
BUILDER - WIN XP 32 Bit	Today at 03:30	Success	Backed up a total of 1.32 GB for 5 changes. (Duration: 1h)
LIVE!! - HABANA	Today at 01:30	Success	Backed up a total of 793.7 MB for 4 changes. (Duration: 1h)
LIVE!! - SQL Server 2008 on Win 7 64Bit	Yesterday at 21:30	Success	Backed up a total of 2.5 GB for 1 change. (Duration: 1h)
BUILDER - WIN XP 32 Bit	Yesterday at 03:30	Success	Backed up a total of 2.91 GB for 5 changes. (Duration: 1h)
LIVE!! - HABANA	Yesterday at 01:30	Success	Backed up a total of 712.94 MB for 4 changes. (Duration: 1h)
LIVE!! - SQL Server 2008 on Win 7 64Bit	03 August 2011 at 21:30	Success	Backed up a total of 2.5 GB for 1 change. (Duration: 1h)
BUILDER - WIN XP 32 Bit	03 August 2011 at 03:30	Success	Backed up a total of 2.91 GB for 5 changes. (Duration: 1h)
LIVE!! - HABANA	03 August 2011 at 01:30	Success	Backed up a total of 712.94 MB for 4 changes. (Duration: 1h)
LIVE!! - SQL Server 2008 on Win 7 64Bit	02 August 2011 at 21:30	Success	Backed up a total of 1.61 GB for 1 change. (Duration: 1h)
BUILDER - WIN XP 32 Bit	02 August 2011 at 03:30	Success	Backed up a total of 2.49 GB for 5 changes. (Duration: 1h)
LIVE!! - HABANA	02 August 2011 at 01:30	Success	Backed up a total of 712.94 MB for 4 changes. (Duration: 1h)
LIVE!! - SQL Server 2008 on Win 7 64Bit	01 August 2011 at 21:30	Success	Backed up a total of 1.63 GB for 1 change. (Duration: 1h)
BUILDER - WIN XP 32 Bit	01 August 2011 at 03:30	Success	Backed up a total of 1.48 GB for 5 changes. (Duration: 1h)
LIVE!! - HABANA	01 August 2011 at 01:30	Success	Backed up a total of 753.19 MB for 4 changes. (Duration: 1h)
LIVE!! - SQL Server 2008 on Win 7 64Bit	31 July 2011 at 21:30	Success	Backed up a total of 1.71 GB for 1 change. (Duration: 1h)
BUILDER - WIN XP 32 Bit	31 July 2011 at 03:30	Success	Backed up a total of 1.37 GB for 5 changes. (Duration: 1h)
LIVE!! - HABANA	31 July 2011 at 01:30	Success	Backed up a total of 687.44 MB for 4 changes. (Duration: 1h)
LIVE!! - SQL Server 2008 on Win 7 64Bit	30 July 2011 at 21:30	Success	Backed up a total of 1.54 GB for 1 change. (Duration: 1h)
BUILDER - WIN XP 32 Bit	30 July 2011 at 03:30	Success	Backed up a total of 4.22 GB for 5 changes. (Duration: 1h)
LIVE!! - HABANA	30 July 2011 at 01:30	Success	Backed up a total of 760.69 MB for 4 changes. (Duration: 1h)
LIVE!! - SQL Server 2008 on Win 7 64Bit	29 July 2011 at 21:30	Success	Backed up a total of 1.62 GB for 1 change. (Duration: 1h)
BUILDER - WIN XP 32 Bit	29 July 2011 at 03:30	Success	Backed up a total of 1.4 GB for 5 changes. (Duration: 1h)
LIVE!! - HABANA	29 July 2011 at 01:30	Success	Backed up a total of 745.94 MB for 4 changes. (Duration: 1h)
LIVE!! - SQL Server 2008 on Win 7 64Bit	28 July 2011 at 21:30	Success	Backed up a total of 2.86 GB for 1 change. (Duration: 1h)

You will now be presented with the following screen:

Delete old backup versions

You can delete old backup versions to free up space on your backup drive.

☒ Delete versions older than 10 June 2011 from Web Server 2

☐ Delete versions older than 10 June 2011 from Web Server 1

☐ Delete versions older than from Test Windows 7 Machine

☐ Delete versions older than from SQL Server

☐ Delete versions older than from Exchange Server

Delete old versions Cancel

To delete old versions:

1. Choose the checkboxes to indicate on which VMs you would like to perform version maintenance.
2. From the drop down lists select a "delete if older than" date, which may be independent for each VM. Versions which were created at a time which is older than the selected date will be marked for deletion.

3. Click on "Delete Old Versions".
4. You will now be presented with a progress bar which will indicate when the selected old versions have been deleted.

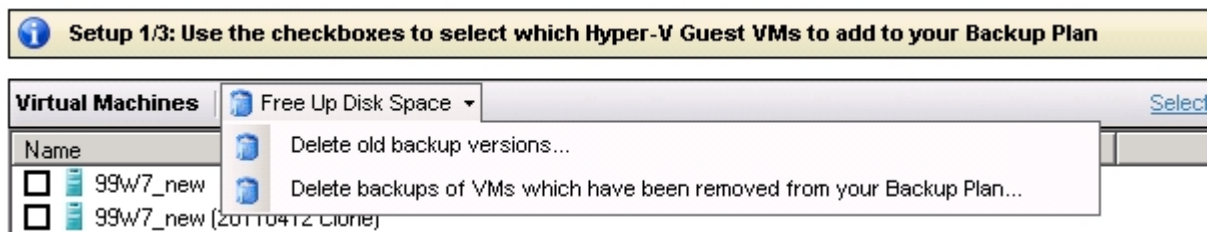

Please keep in mind that the graphs show the maximum size that existed on any one particular day, so the change in size may not be visible immediately on the dashboard.

Delete Backups of VMs that have been removed from your Backup Plan

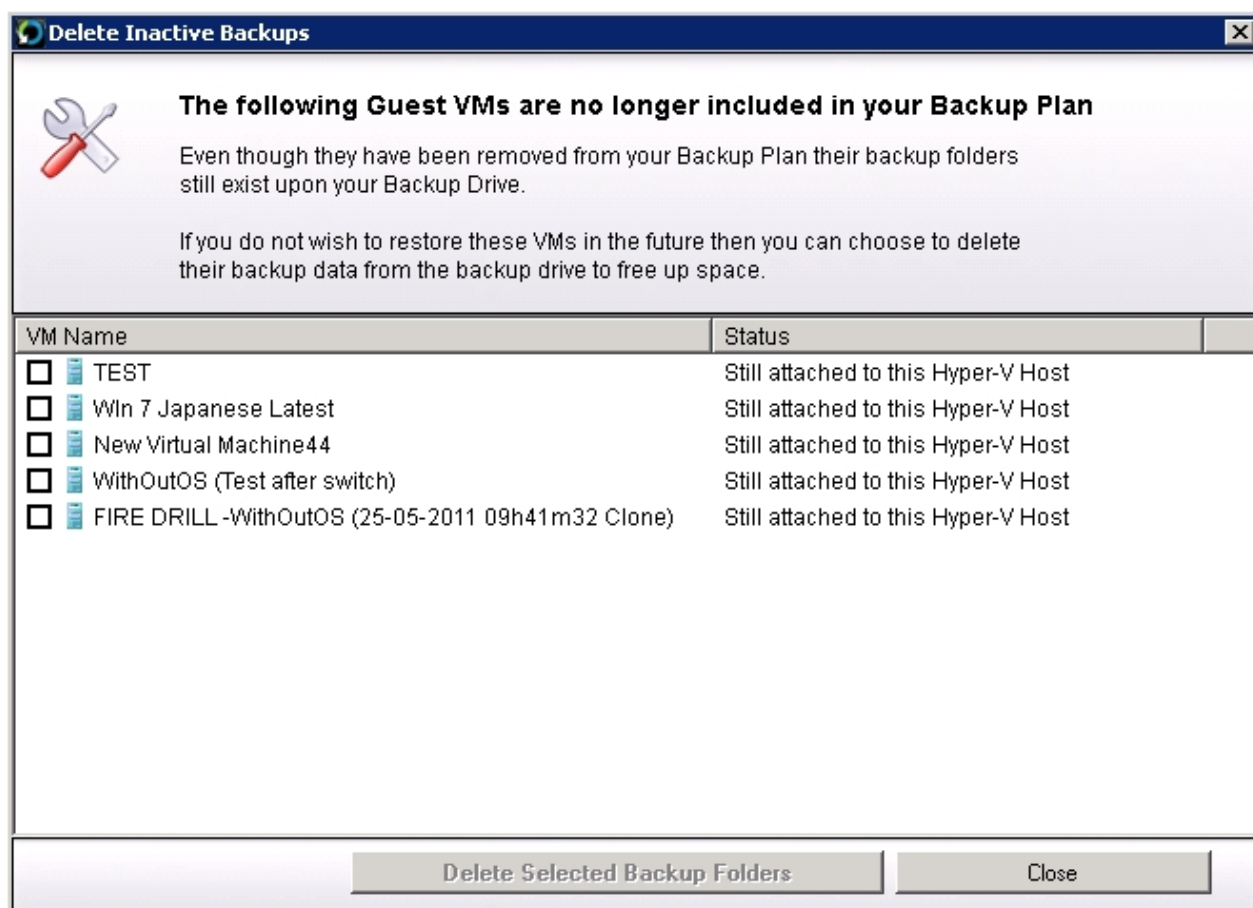

When you remove a VM from your Backup Plan (using the VM Browser as explained [here](#)) the backup folder containing that VMs backup files is not deleted. This is intentional to allow users to reselect the VM and restore previous versions at a later date. There may be cases where the user is no longer interested in keeping the old backup folders and would like to free up space on the backup drive.

This utility will facilitate deletion of old backup folder. Please note that once a backup folder is deleted then you will not be able to restore that VM until it is backed up again.

1. You can access this feature from the [VM Browser](#) and the [Backup History Report](#) as shown in the next screenshot.

2. Once launched the utility will list all VMs for which a backup folder exists on the backup drive, but the VM is no longer being backed up.

3. You may use the check boxes to select one or more backup folders to delete. Once the selections are made then you can simply click on "Delete Selected Backup Folders". You will be prompted for confirmation before the deletion starts.

4. Once deletion is complete you will be notified and the list of VM Backups pending deletion will be updated.
